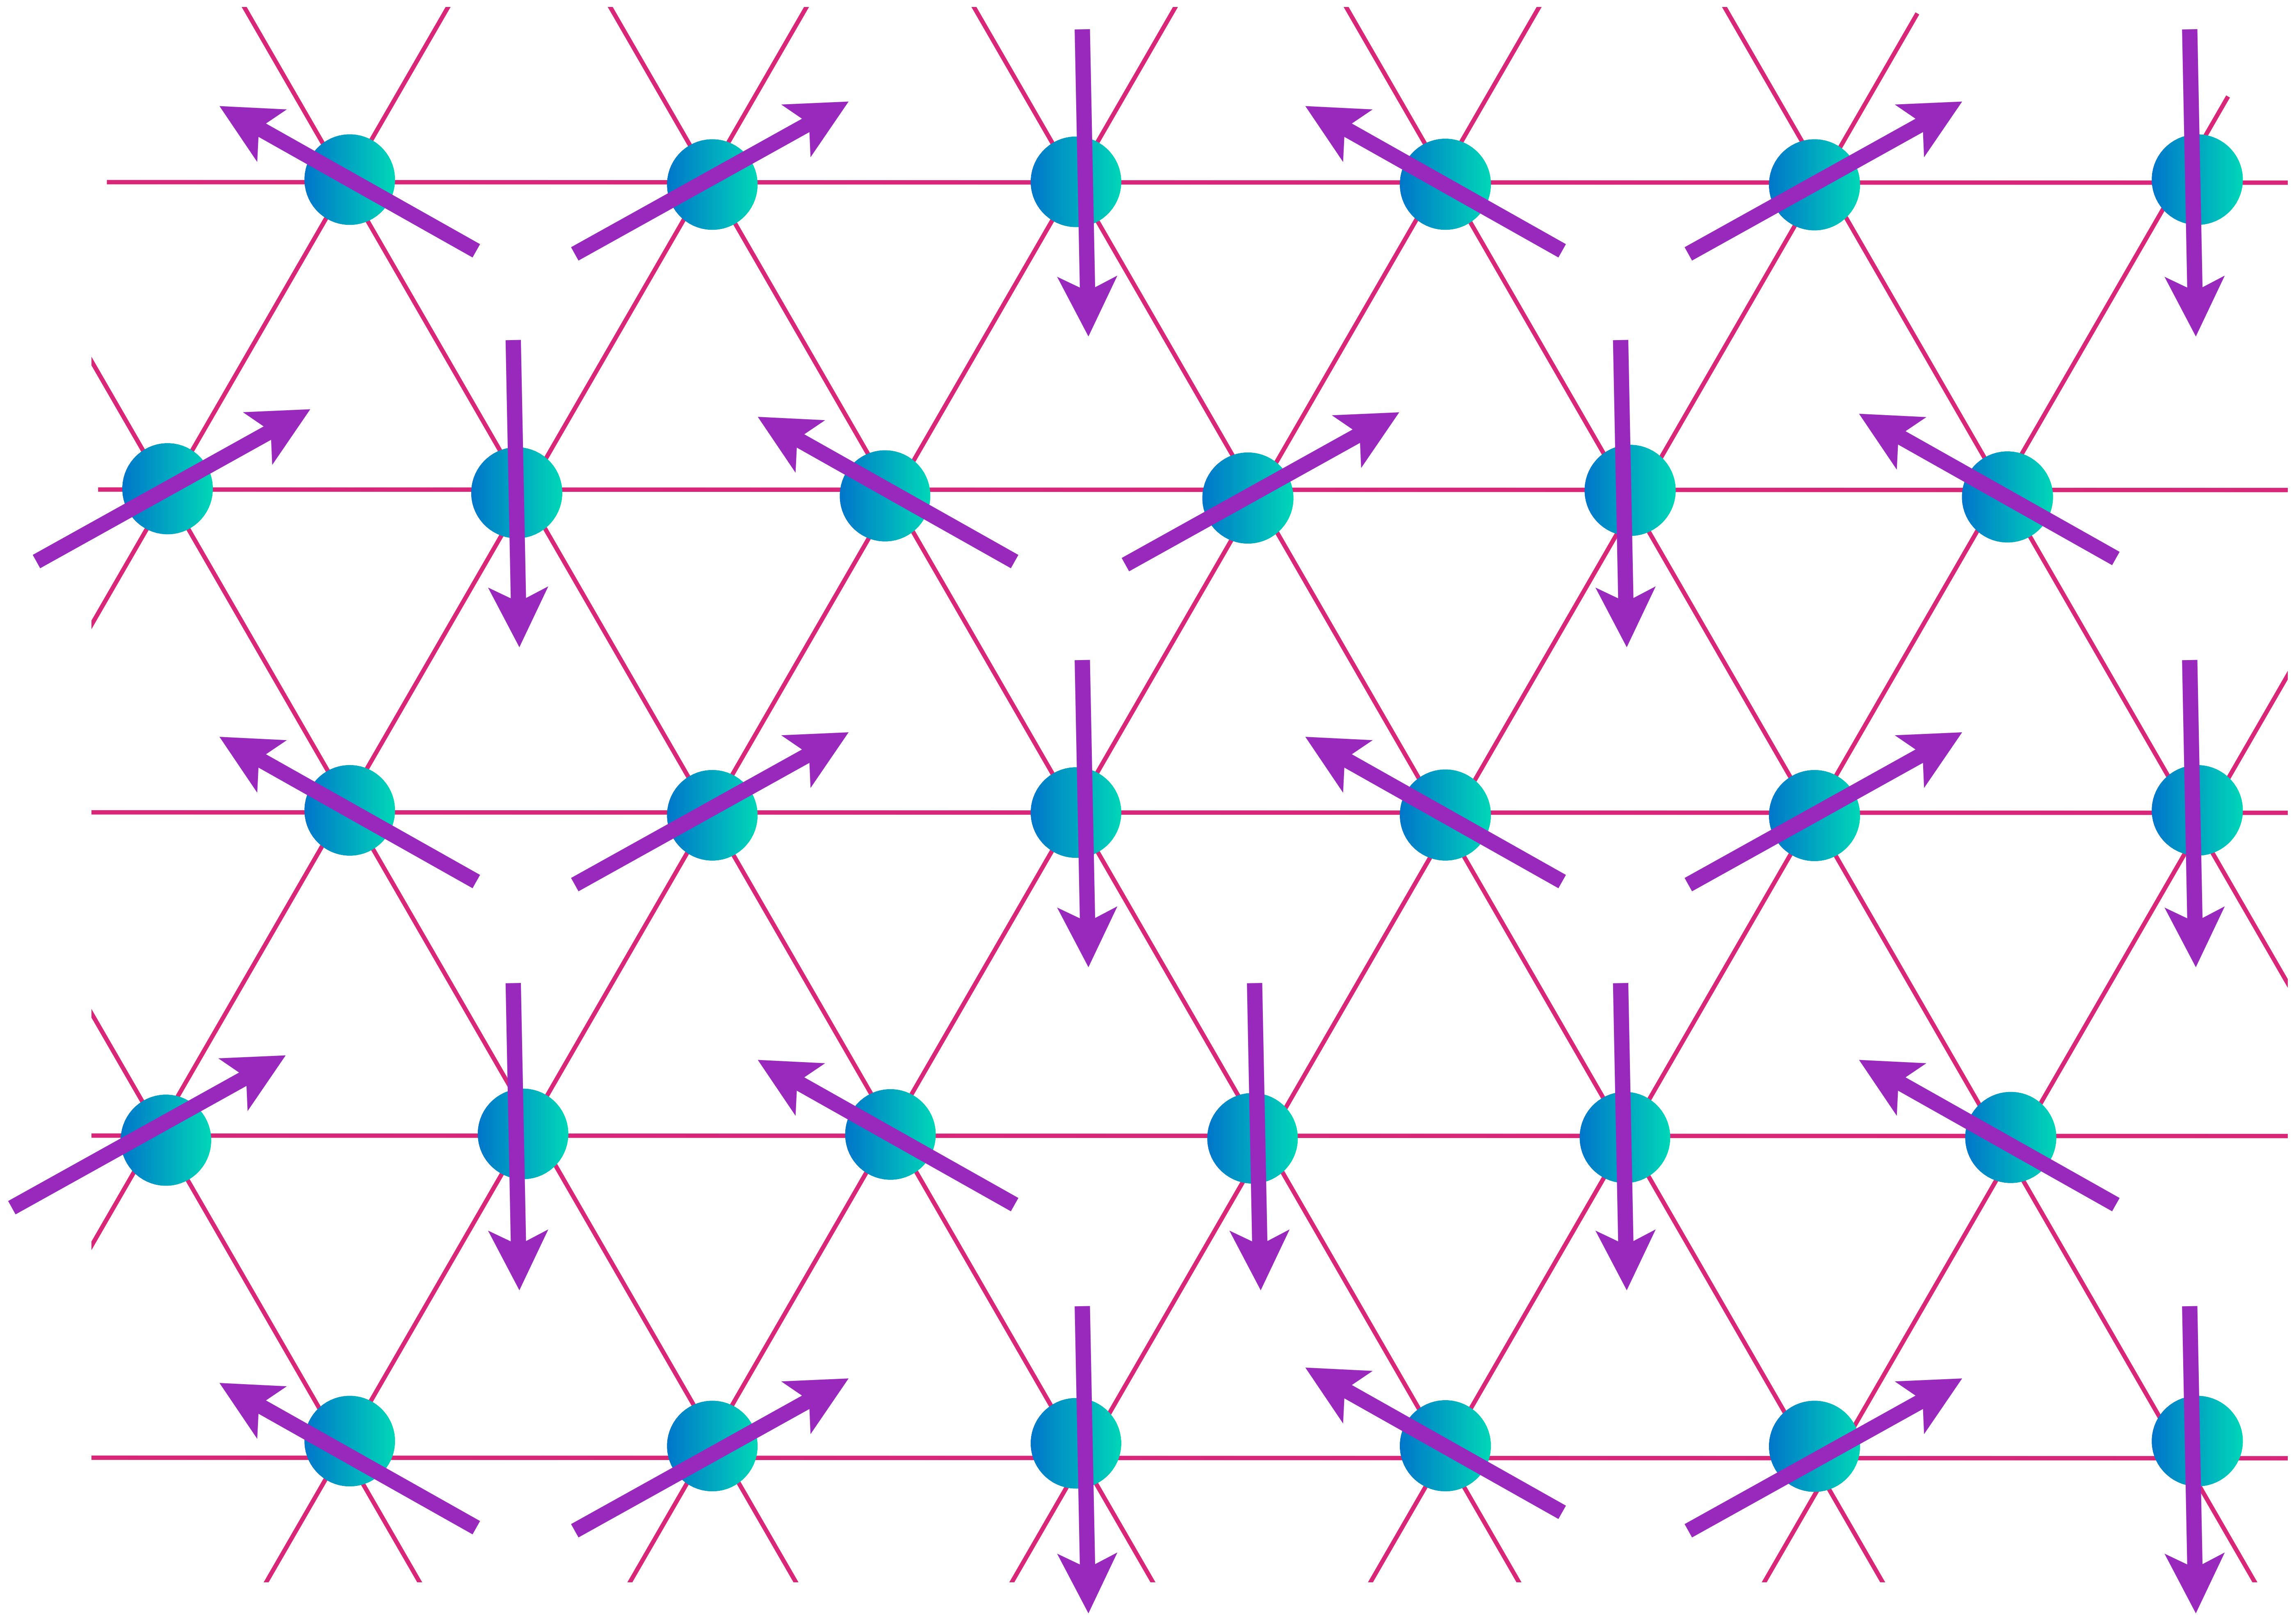
Triangular lattice antiferromagnet

$$H = J \sum_{\langle ij \rangle} \vec{S}_i \cdot \vec{S}_j$$



Nearest-neighbor model has non-collinear Neel order

Mapping of bosons and spins

Boson B

$B^\dagger B \le 1$

States $|0\rangle$, $B^\dagger|0\rangle$

Operators

$B^\dagger \longleftrightarrow S_+ = S_x + iS_y$

$B \longleftrightarrow S_- = S_x - iS_y$

$B^\dagger B - \frac{1}{2} \longleftrightarrow S_z$

Spin $\vec{S}$

$\vec{S}^2 = 3/4$

States $|\uparrow\rangle$ $|\downarrow\rangle$

Operators

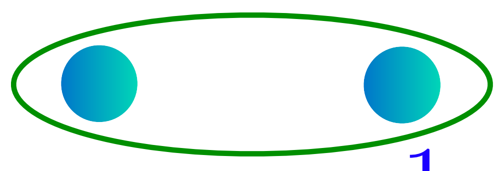
$S_+ = S_x + iS_y$

$S_- = S_x - iS_y$

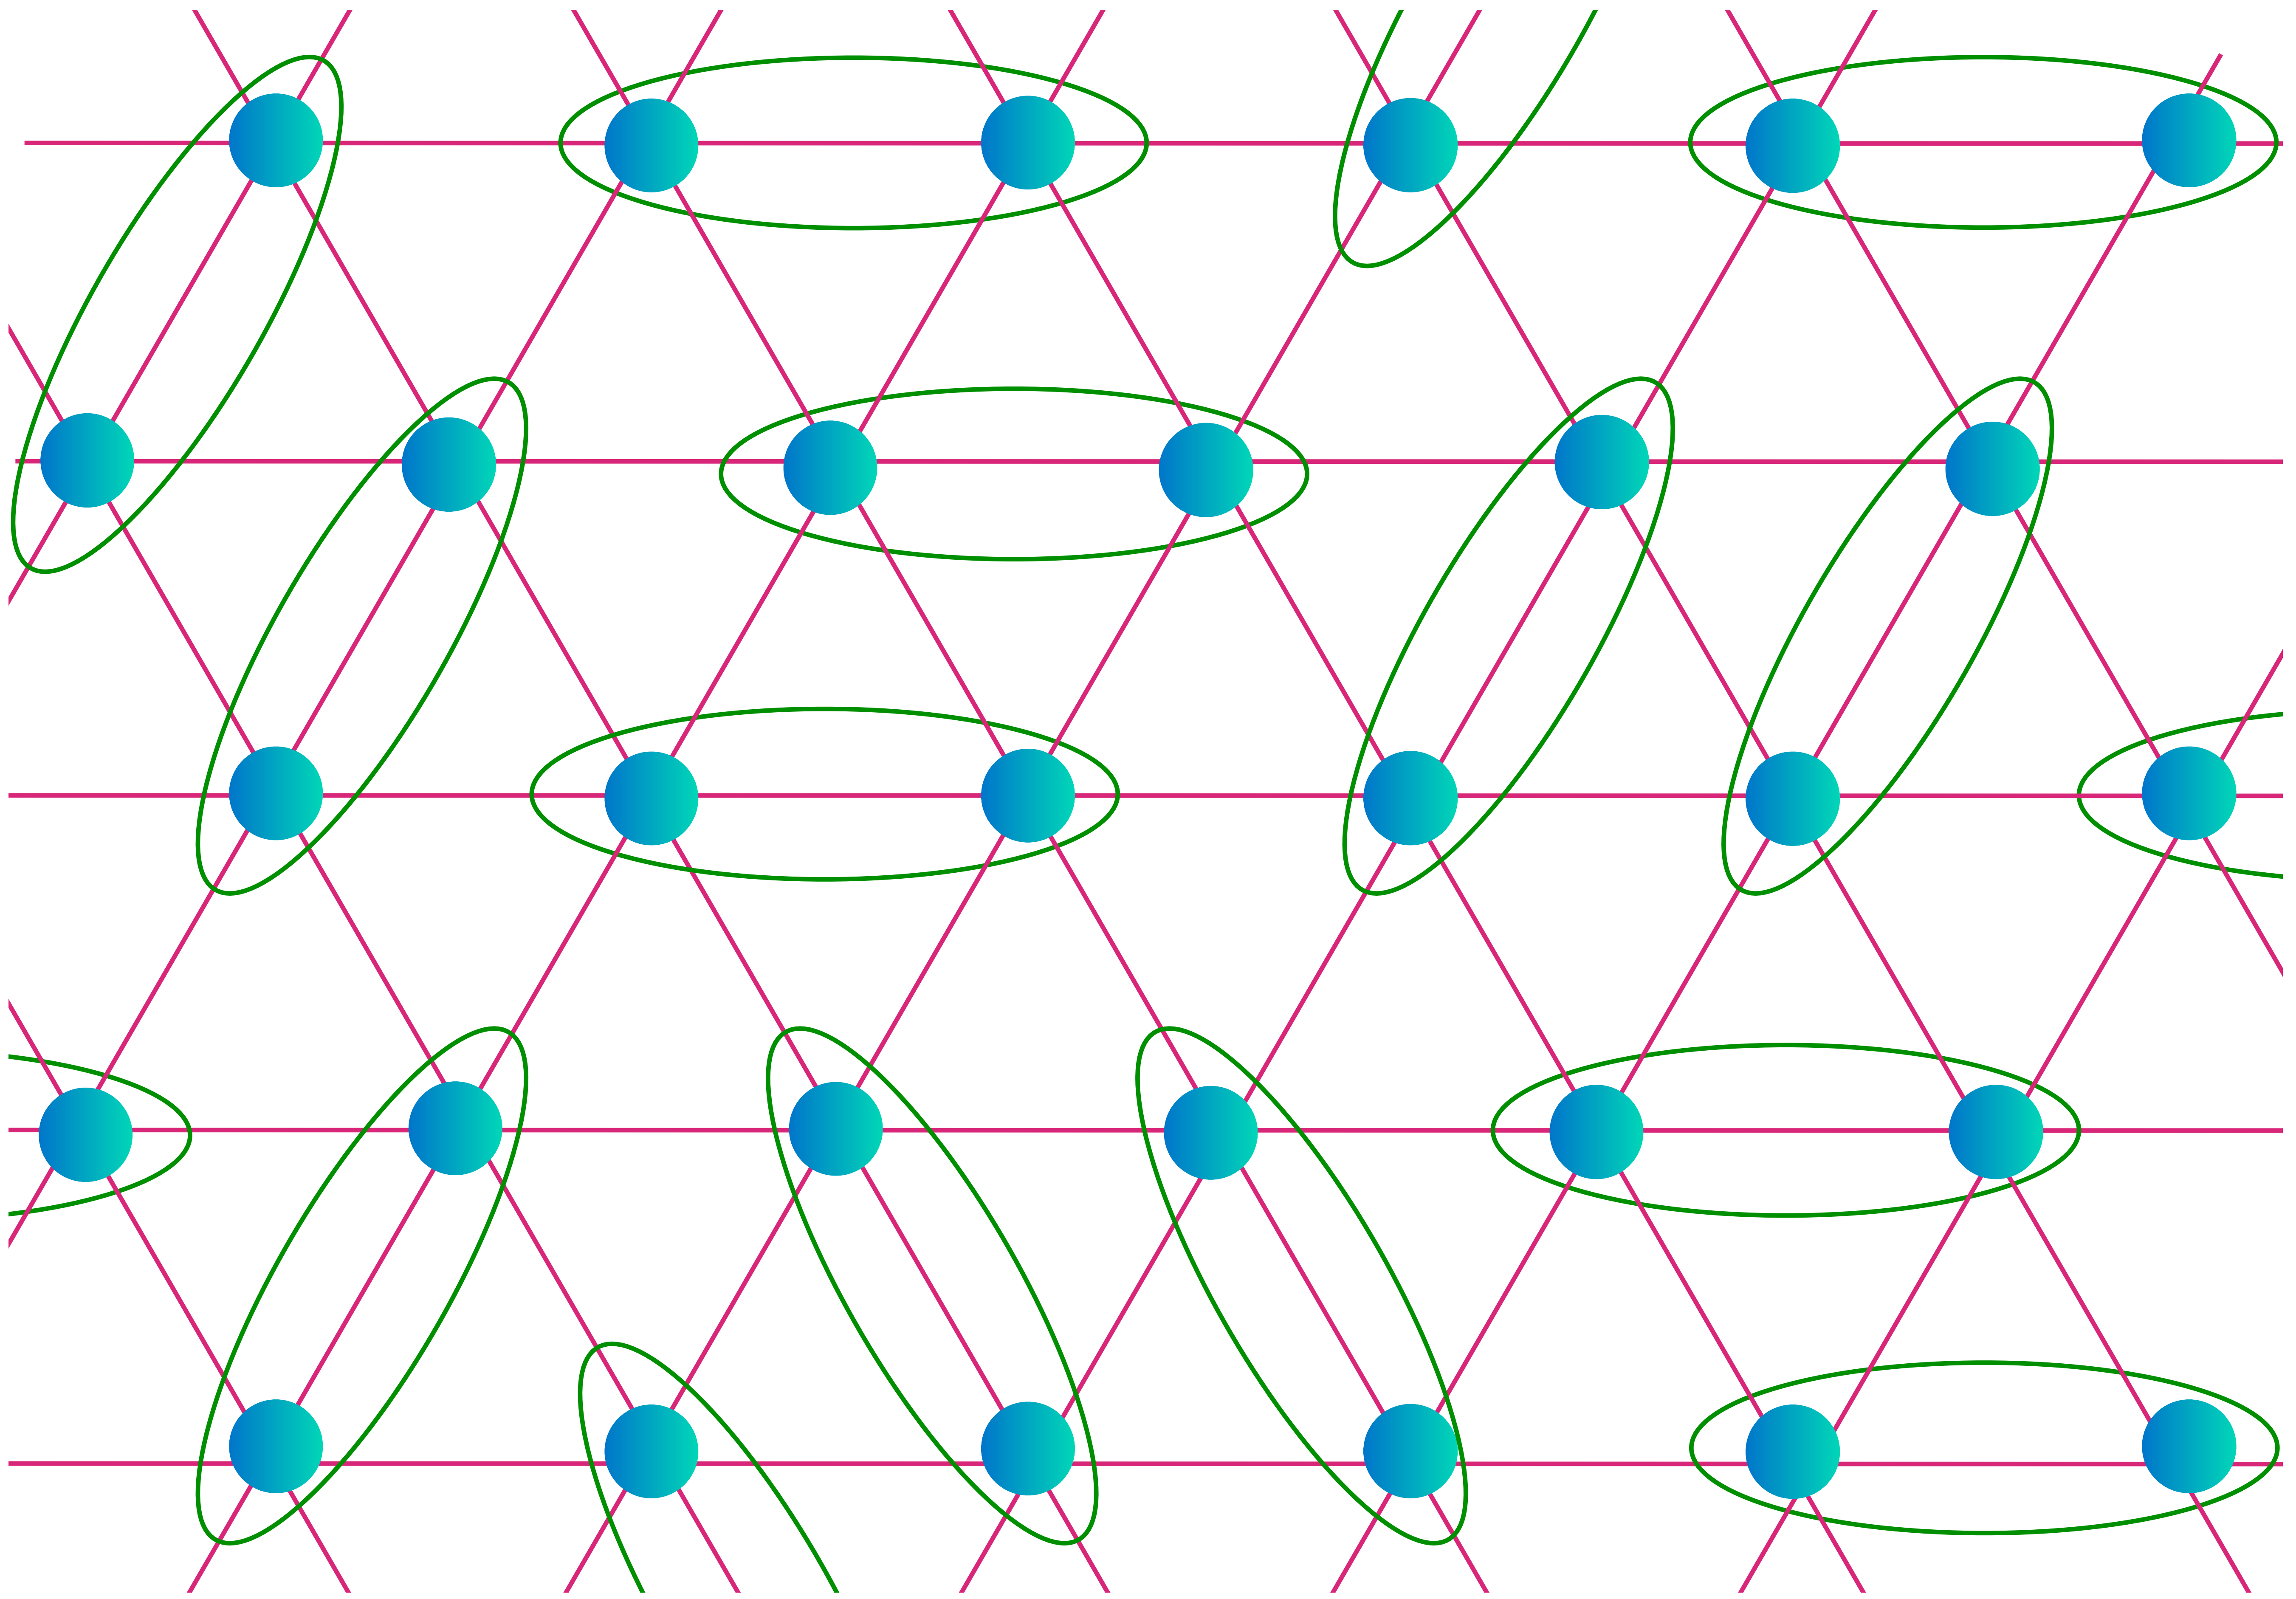
S_z

Spin liquid: resonating valence bonds

Bosons at half-filling,
or a spin model with S=1/2 per unit cell



$$= \frac{1}{\sqrt{2}} \left(|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle \right) = \frac{1}{\sqrt{2}} \left(B_1^\dagger - B_2^\dagger \right) |0\rangle$$



$$|G\rangle = \sum_{\mathcal{D}} c_{\mathcal{D}} \, |\mathcal{D}\rangle$$

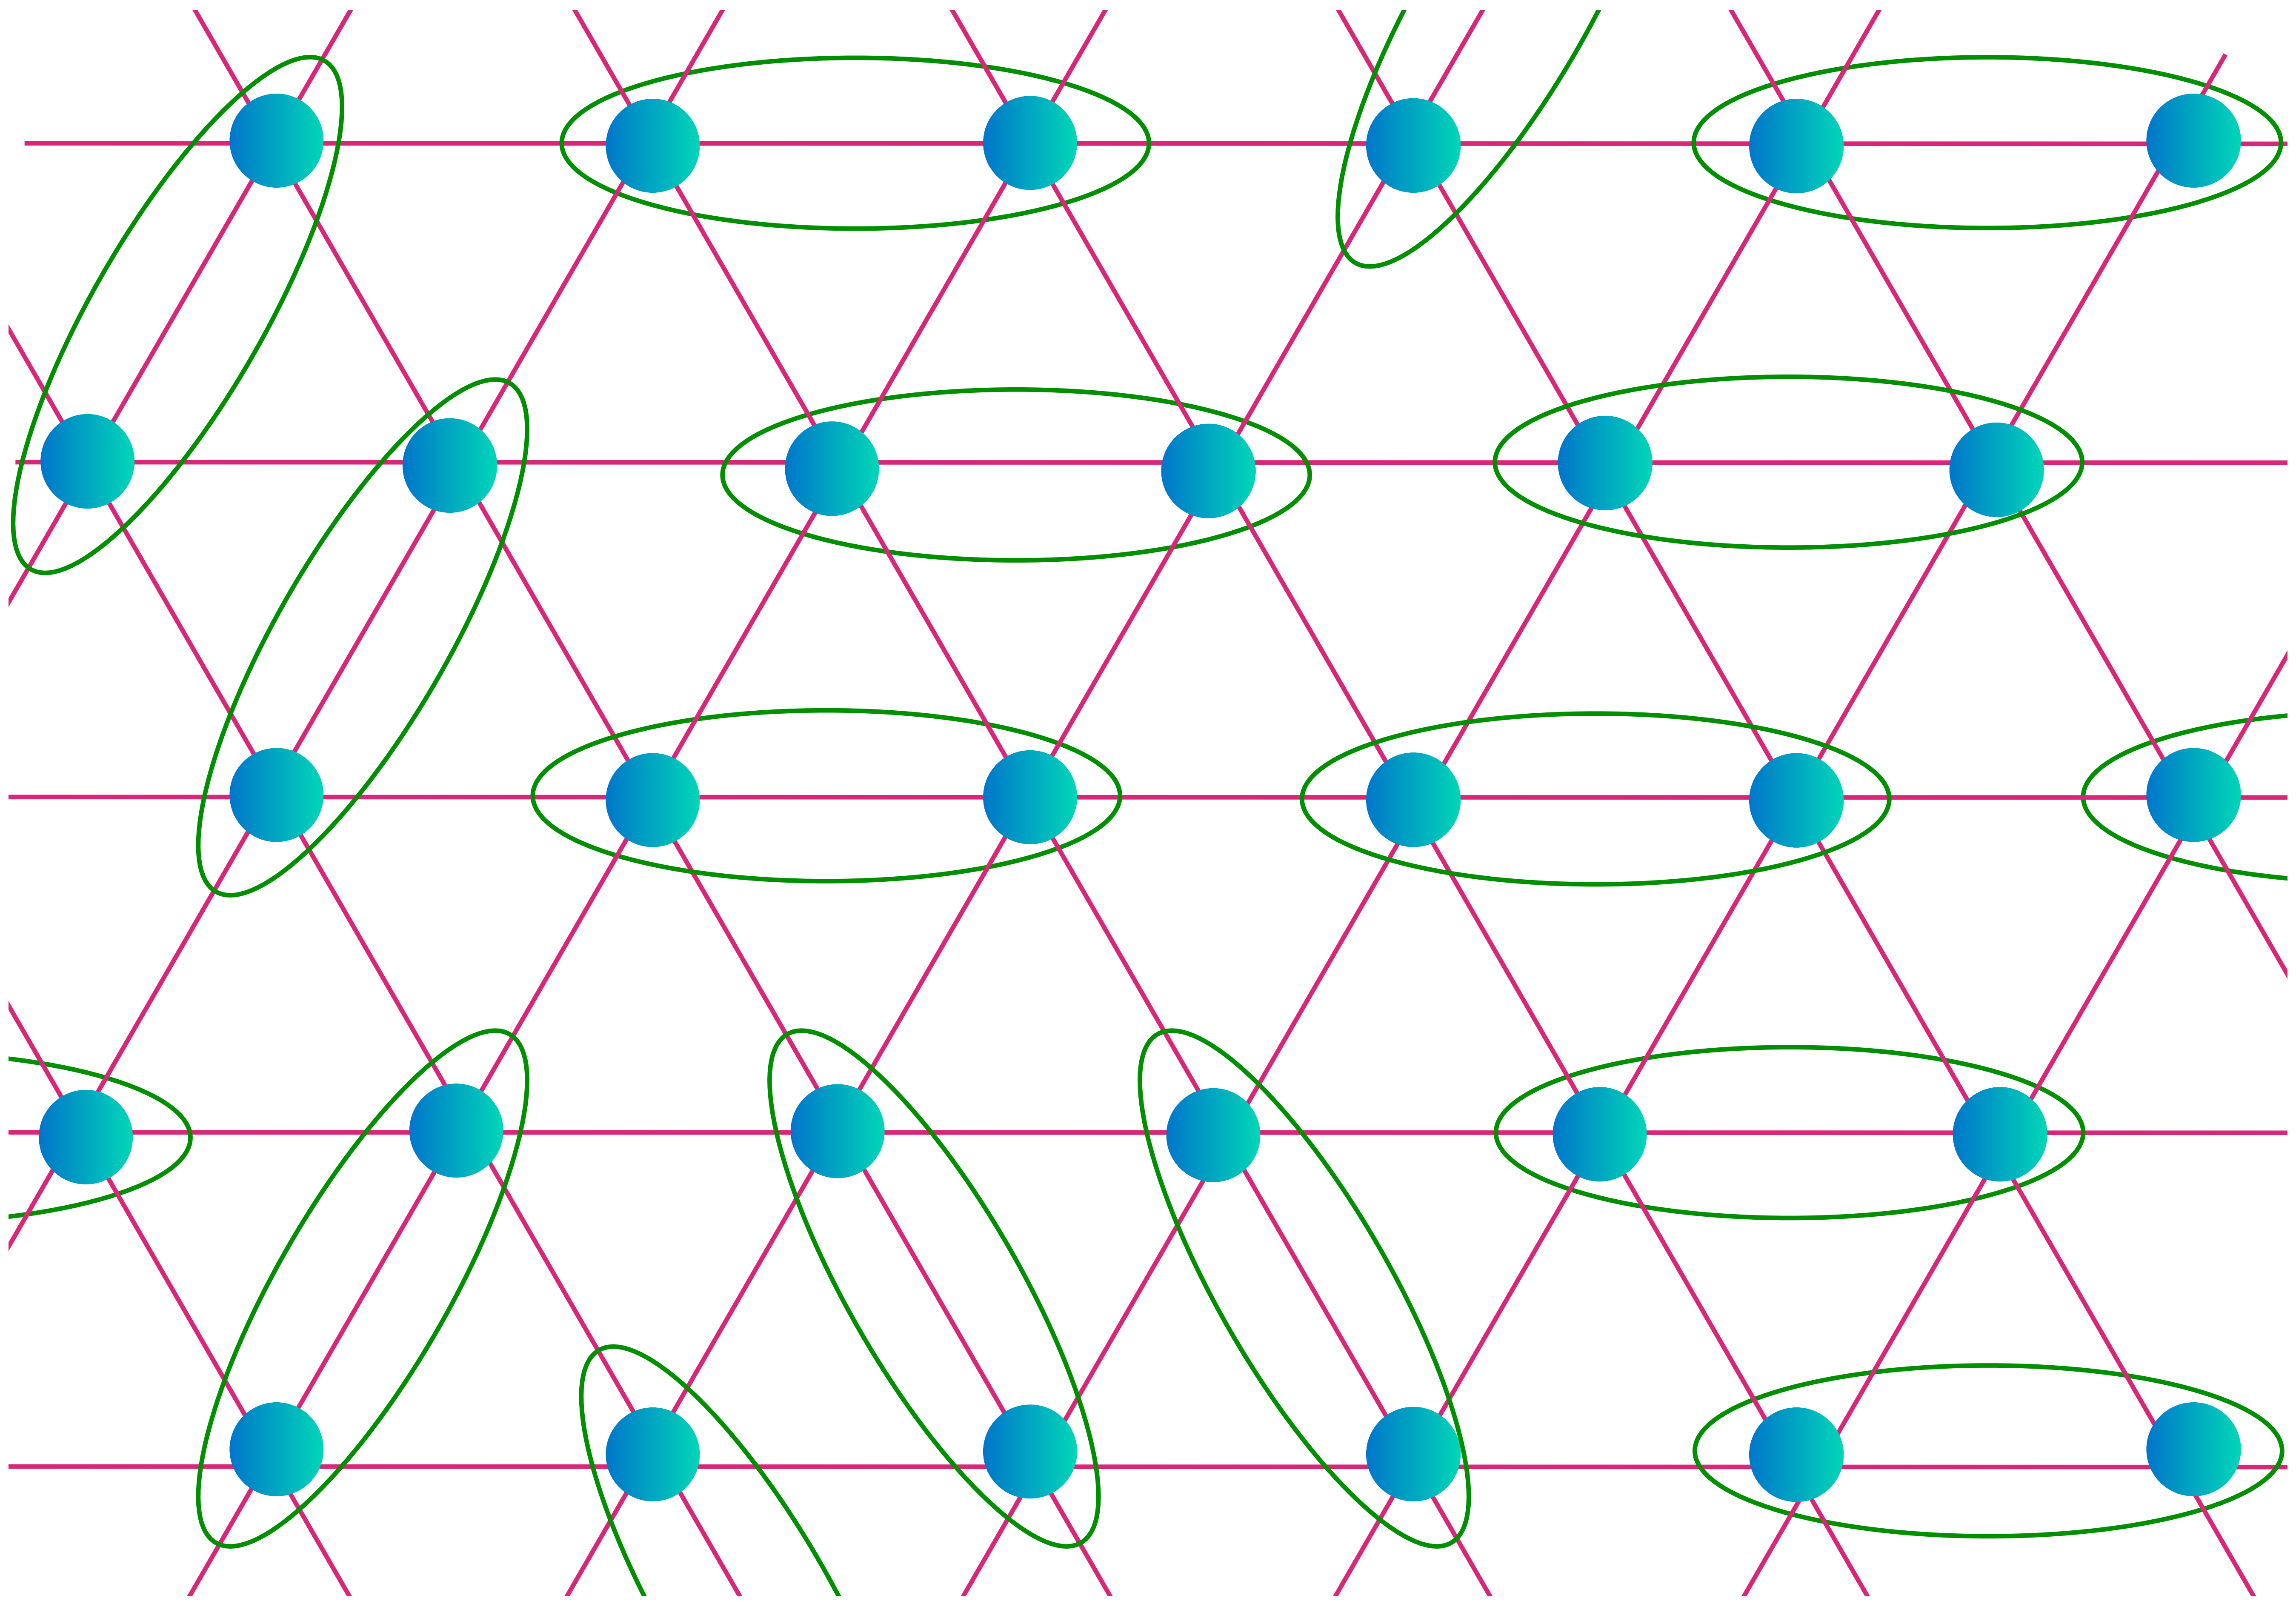
$\mathcal{D} \rightarrow$ dimer covering of lattice

P. Fazekas and P. W. Anderson, *Philos. Mag.* **30**, 23 (1974).

Spin liquid: resonating valence bonds

Bosons at half-filling,
or a spin model with *S*=1/2 per unit cell

$$= \frac{1}{\sqrt{2}} \left(| \uparrow\downarrow \rangle - | \downarrow\uparrow \rangle \right) = \frac{1}{\sqrt{2}} \left(B_1^\dagger - B_2^\dagger \right) |0\rangle$$



$$|G\rangle = \sum_{\mathcal{D}} c_{\mathcal{D}} \, |\mathcal{D}\rangle$$

$\mathcal{D} \rightarrow$ dimer covering of lattice

RVB: Z_2 spin liquid

Read and Sachdev (1990); Wen (1991)

The simplest stable spin liquid (which need not break time-reversal) is the deconfined phase of a $\mathbb{Z}_2$ gauge theory. There are 'spinon' excitations which carry unit $\mathbb{Z}_2$ electric charges, and 'vison' excitations which carry π $\mathbb{Z}_2$ magnetic flux.

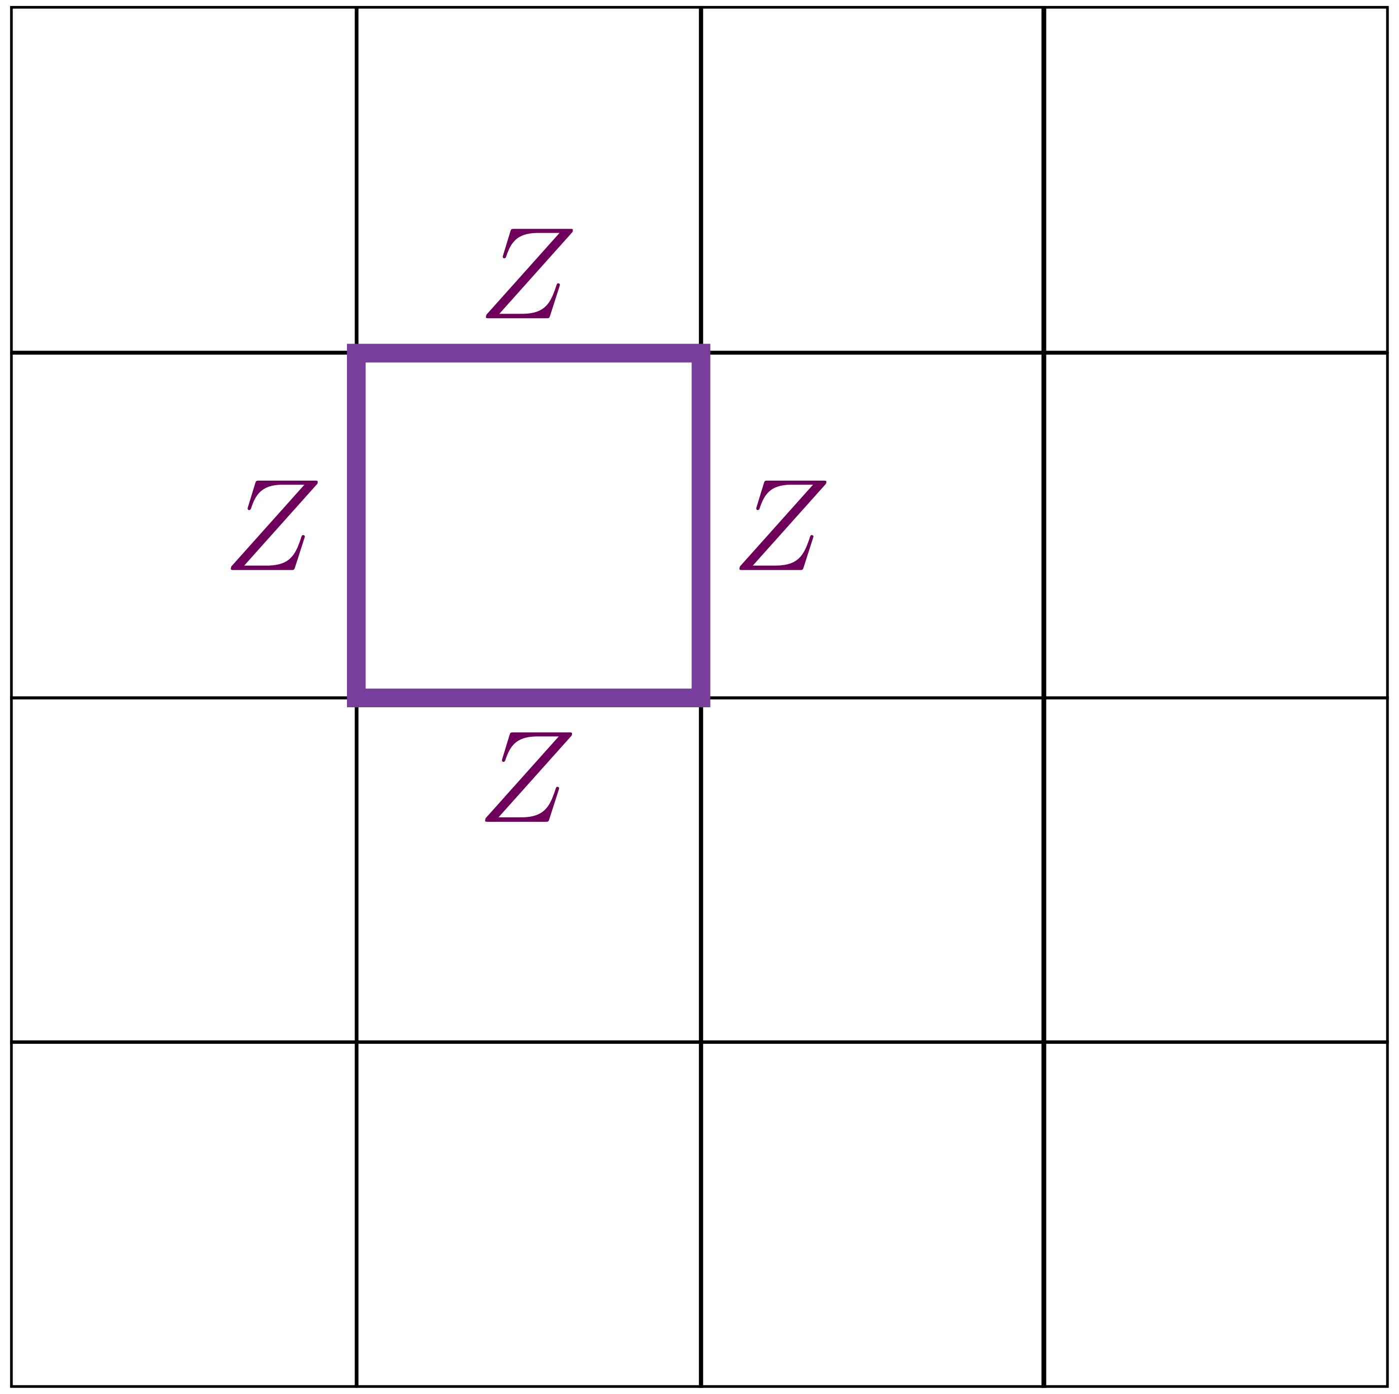
Anyon	e (spinon)	ϵ (spinon)	m (vison)
Boson number	$1/2$	$1/2$	0
Self-statistics	boson	fermion	boson

Any pair of e, ϵ, m are mutual semions.

These anyons are 'topological': they cannot be created individually by any local operator, and their existence implies a four-fold ground state degeneracy on a large torus.

Pure Z_2 gauge theory

$$\mathcal{H}_{\mathbb{Z}_2} = -K \sum_{\square} \prod_{\ell \in \square} Z_\ell - g \sum_{\ell} X_\ell$$



$G_i =$ 
$$[\mathcal{H}_{\mathbb{Z}_2}, G_i] = 0 \quad , \quad G_i = (-1)^{2S} \text{ for spin } S \text{ antiferromagnets}$$

Z_2 gauge theory with matter

$$\mathcal{H}_{\mathbb{Z}_2} = -K \sum_{\square} \prod_{\ell \in \square} Z_\ell - g \sum_{\ell} X_\ell$$

$$- J \sum_{\ell \in (i,j)} \tau_i^z Z_\ell \tau_j^z - h \sum_i \tau_\ell^x$$

$$G_i = \tau_i^x \prod_{\ell \in i} X_\ell \quad , \quad [\mathcal{H}_{\mathbb{Z}_2}, G_i] = 0$$

Now we choose $G_i = 1$ and $\mathrm{sgn}(h) = (-1)^{2S}$.

The τ_i^x operator creates a $\mathbb{Z}_2$ electric charge – a 'spinon' which has mutual semionic statistics with a vison.

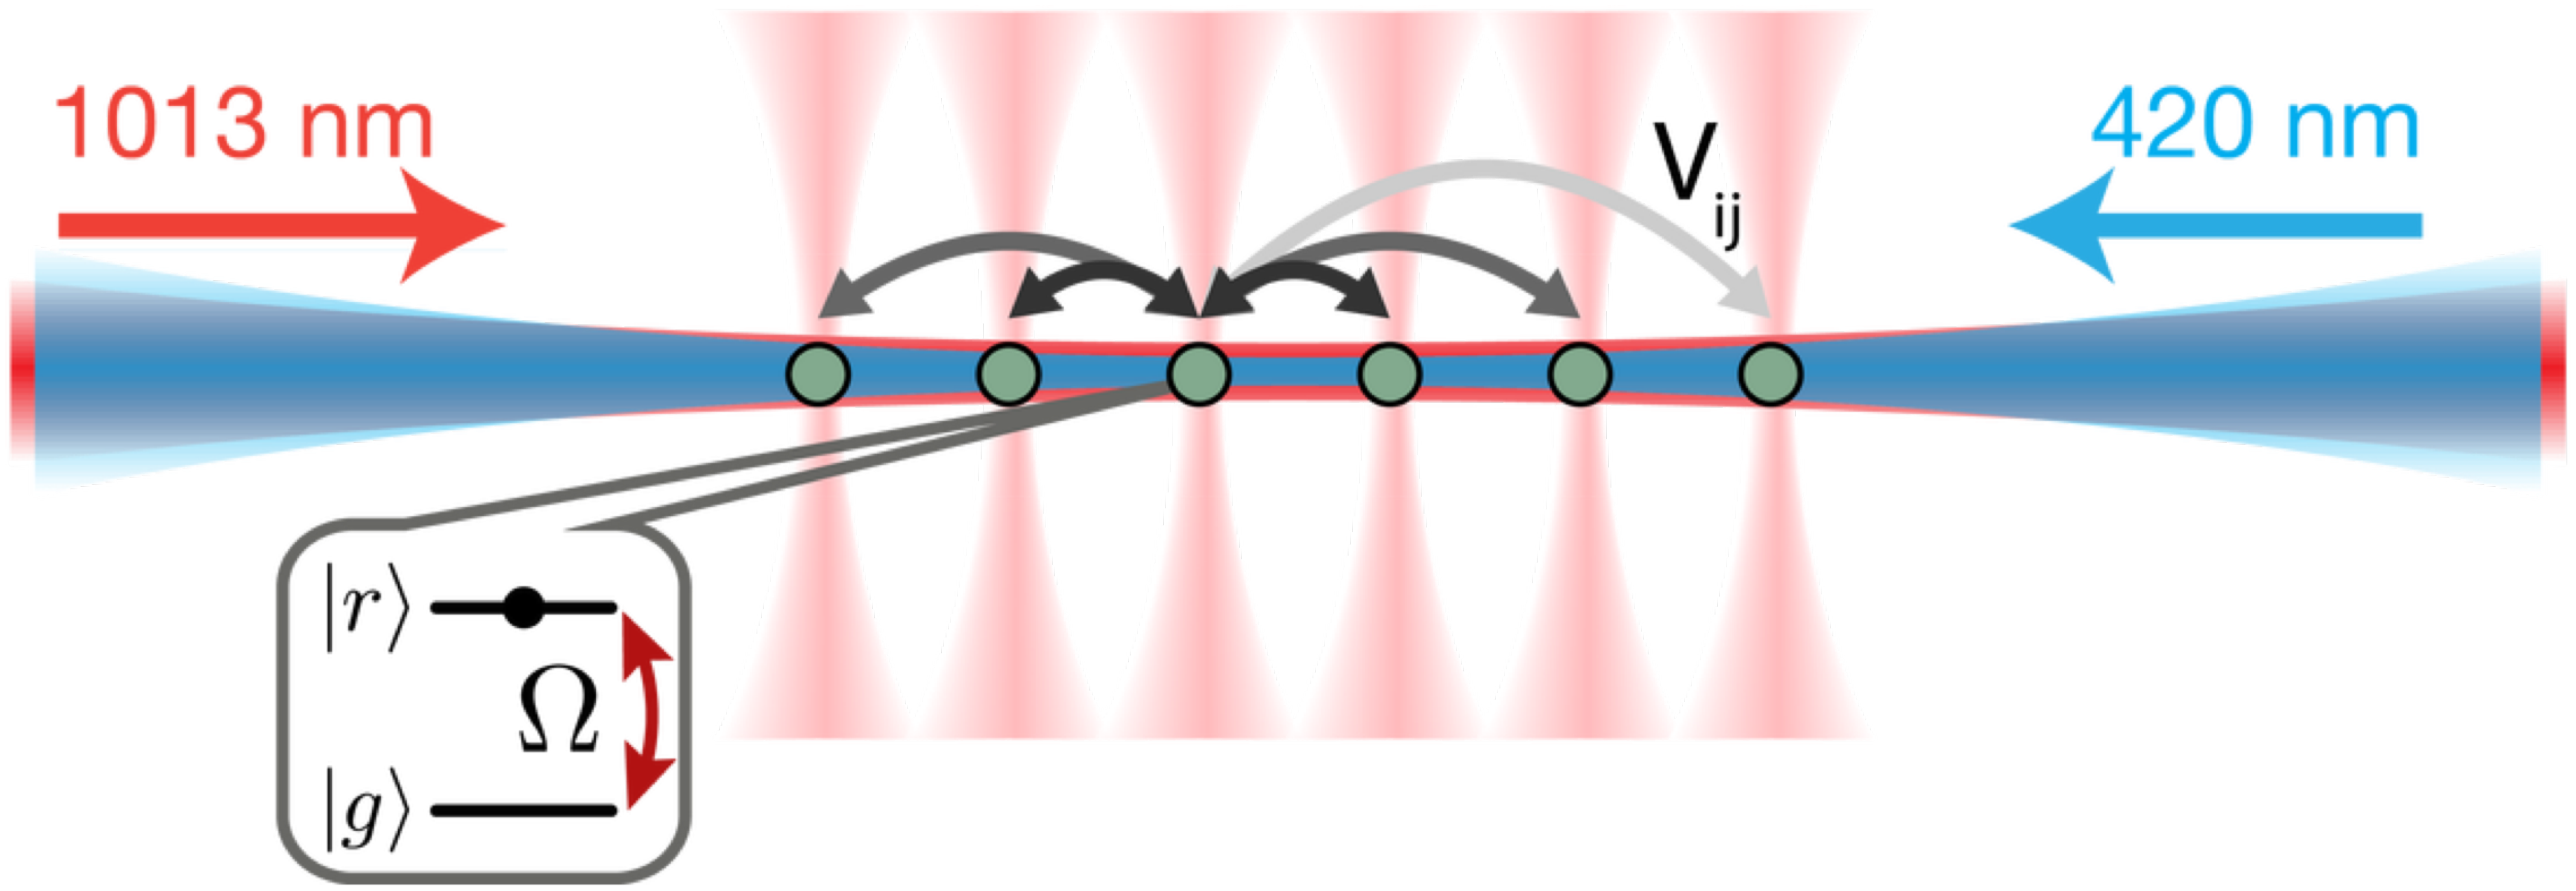
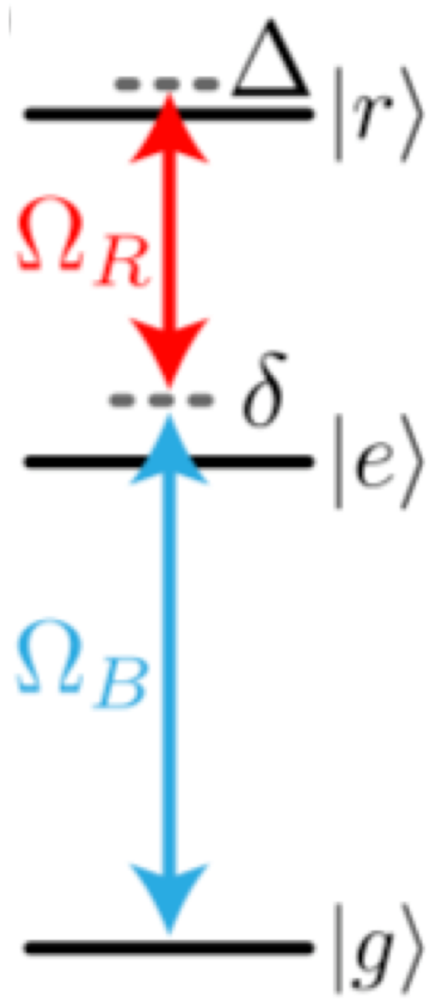
QPTs in a Rydberg quantum simulator





$$|g\rangle \equiv |0\rangle$$

$$|r\rangle \equiv b^\dagger |0\rangle$$

$$\mathcal{H} = \sum_\ell \left[\frac{\Omega}{2} \left(b_\ell + b_\ell^\dagger \right) - \Delta n_\ell \right] + \sum_{\ell < \ell'} V_{|\ell - \ell'|} n_\ell n_{\ell'}$$

$$V_{|\ell-\ell'|} \sim \frac{1}{|\ell - \ell'|^6}$$

$$n_\ell \equiv b_\ell^\dagger b_\ell$$

$n_\ell = 0, 1$ 'hard core' bosons

FSS model

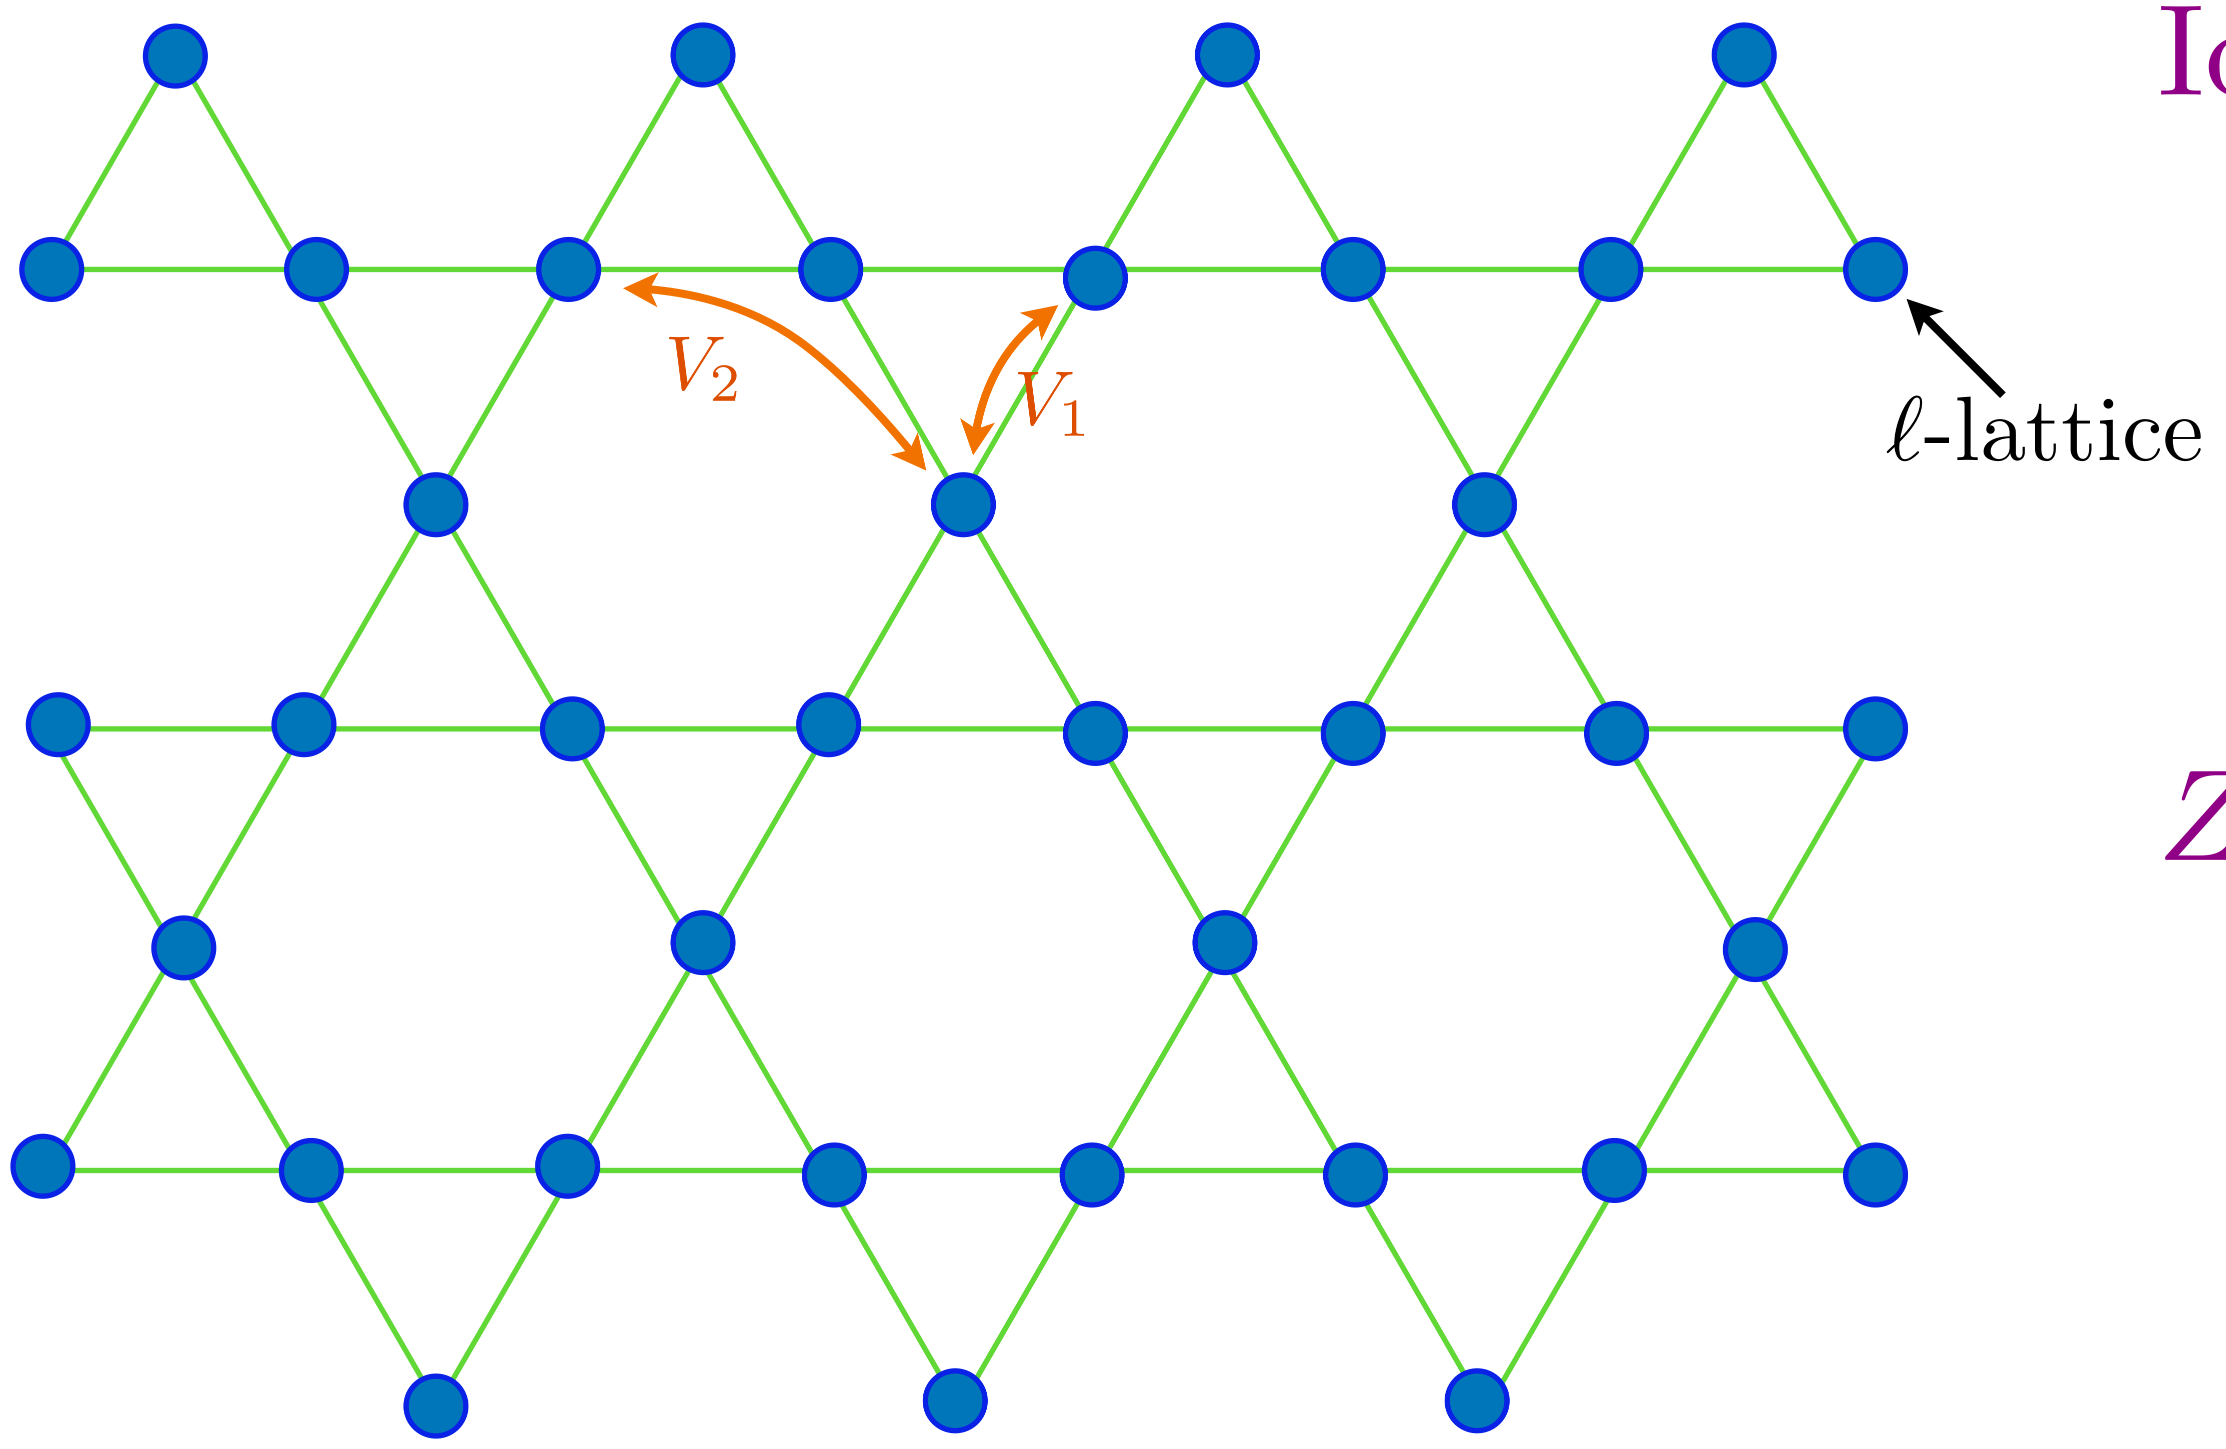
S. Sachdev, K. Sengupta, and S.M. Girvin, PRB **66**, 075128 (2002)
P. Fendley, K. Sengupta, S. Sachdev, PRB **69**, 075106 (2004)

From the FSS model to an emergent $\mathbb{Z}_2$ gauge theory

$$\mathcal{H} = \sum_{\ell} \left[\frac{\Omega}{2} \left(b_\ell + b_\ell^\dagger \right) - \Delta n_\ell \right] + \sum_{\ell < \ell'} V_{|\ell - \ell'|} n_\ell n_{\ell'}$$

$$n_\ell \equiv b_\ell^\dagger b_\ell$$

$$n_\ell = 0, 1 \quad \text{'hard core' bosons}$$



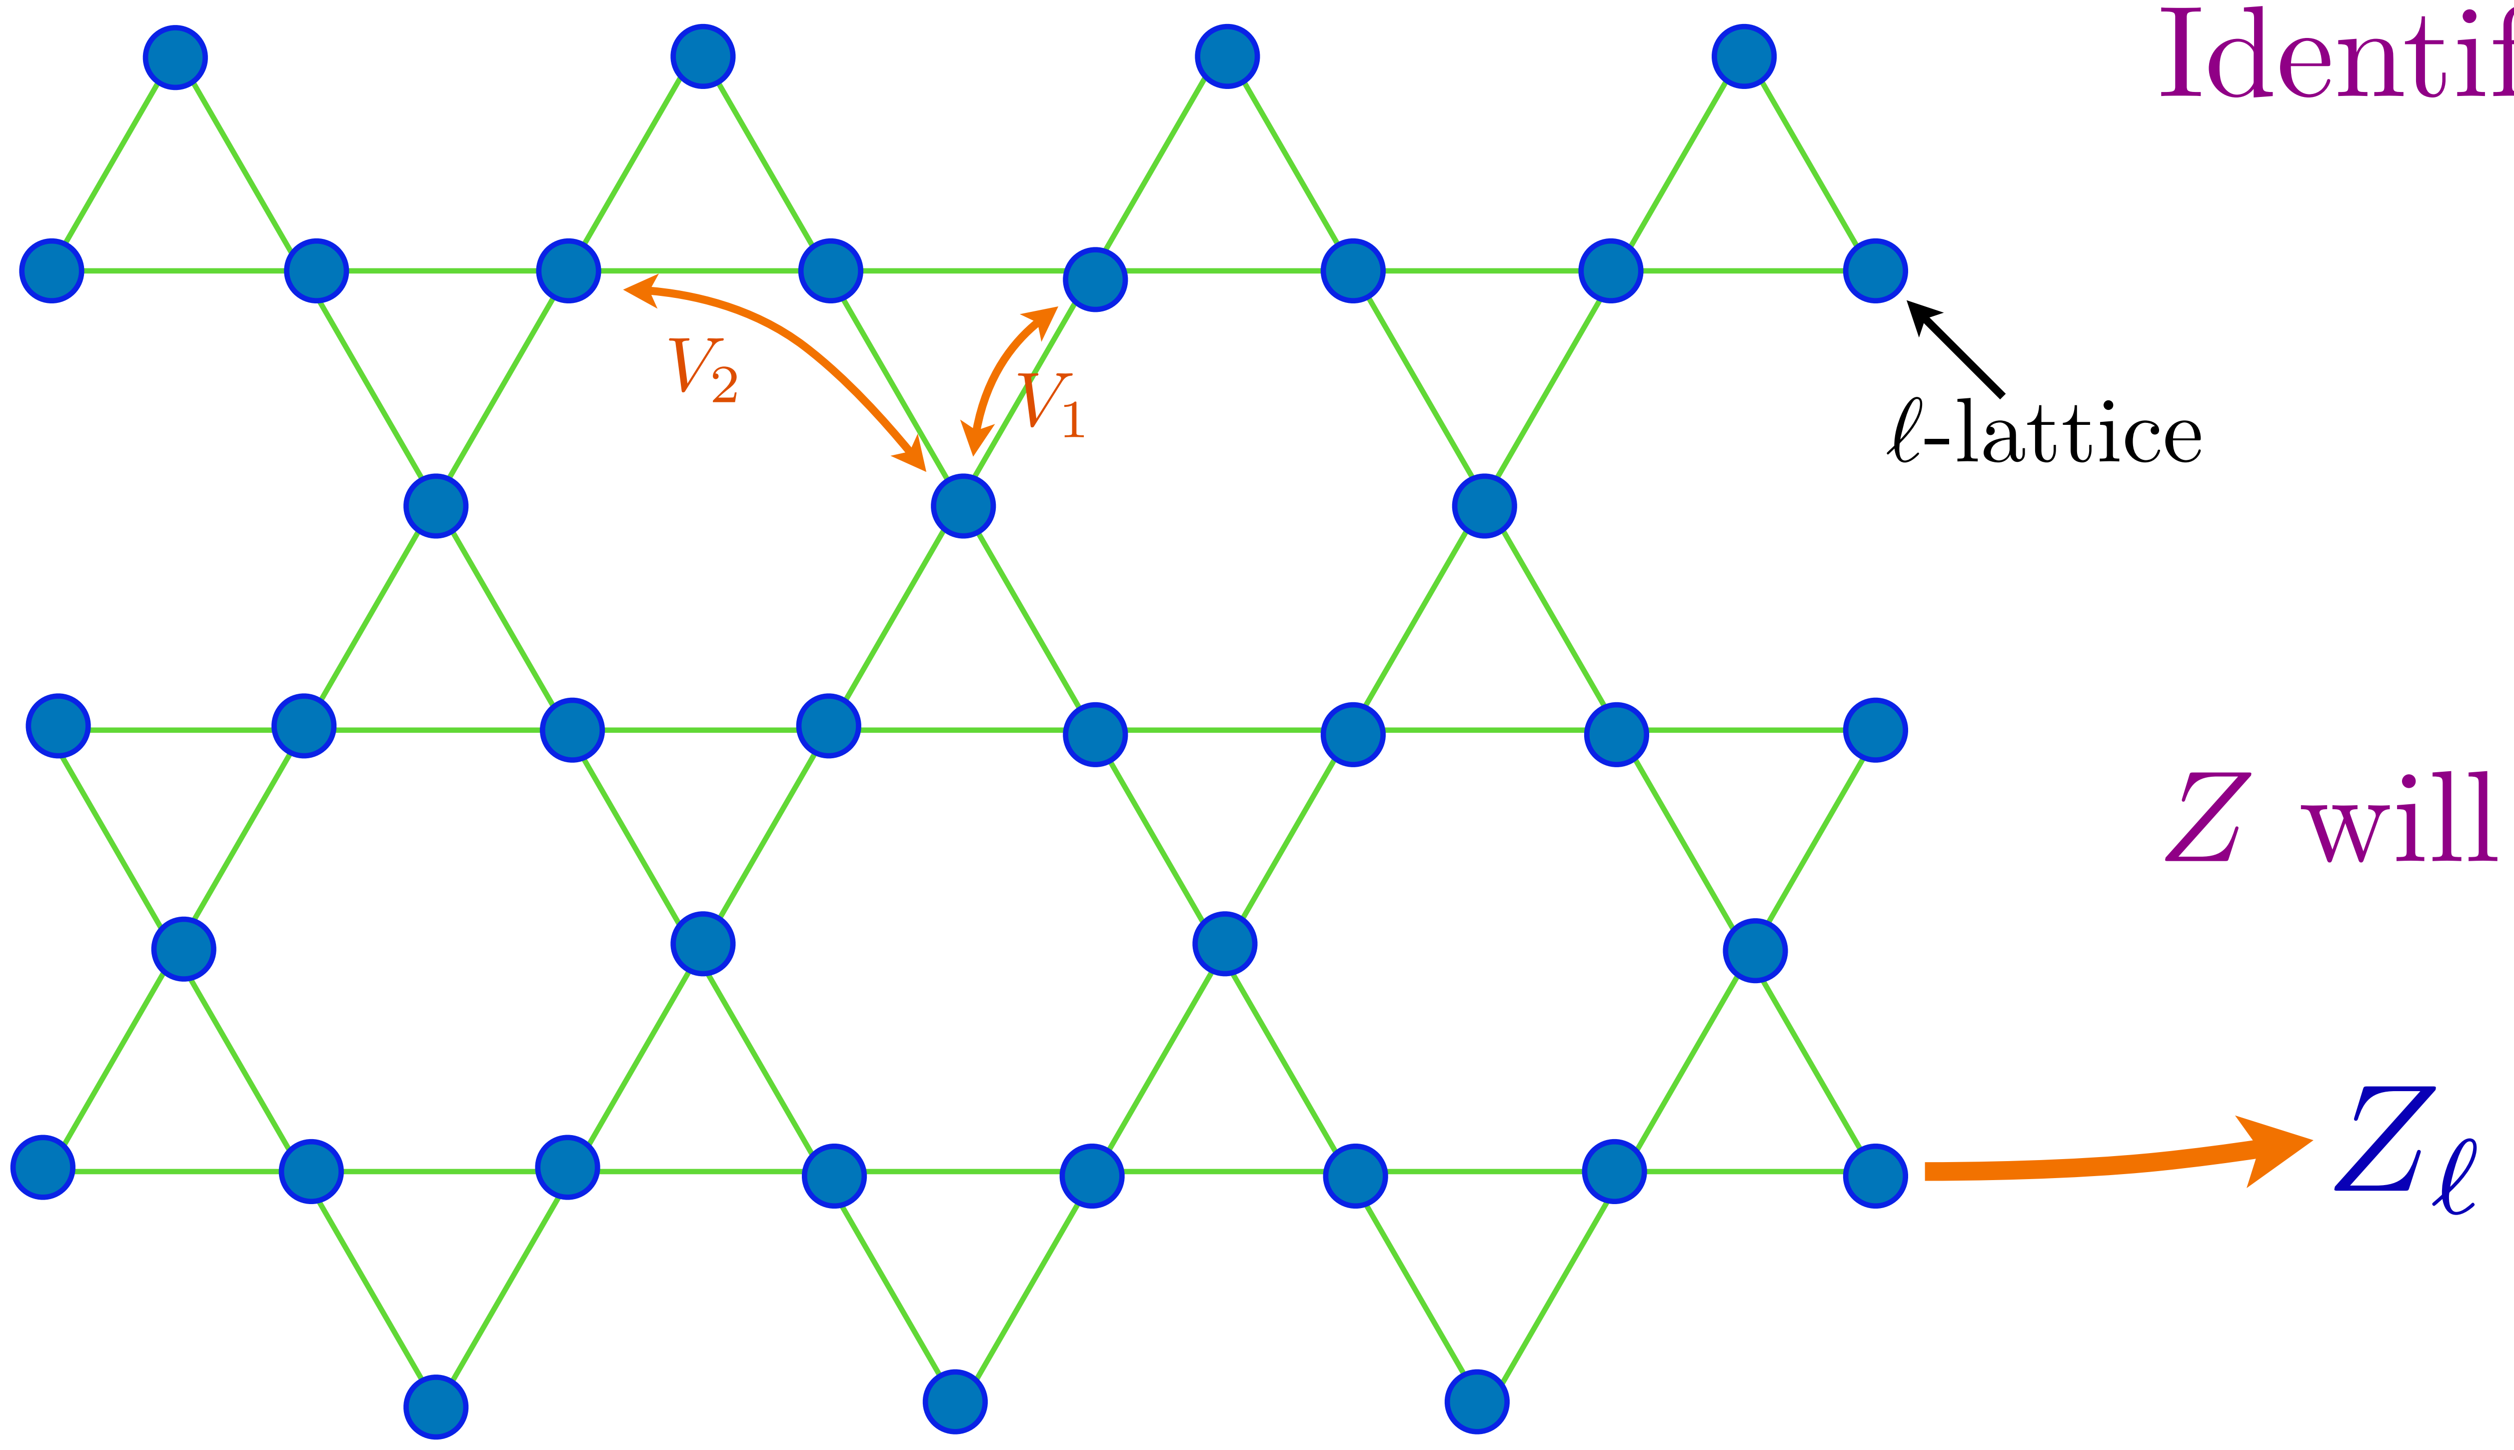
Identify hard core bosons with a qubit X, Y, Z

$$b_\ell + b_\ell^\dagger \quad \Leftrightarrow \quad Z_\ell$$
$$n_\ell \quad \Leftrightarrow \quad (1 - X_\ell)/2$$

Z will become the $\mathbb{Z}_2$ gauge field

From the FSS model to an emergent $\mathbb{Z}_2$ gauge theory

$$\mathcal{H} = \sum_{\ell} \left[\frac{\Omega}{2} Z_\ell + \frac{\Delta}{2} X_\ell \right] + \sum_{\ell < \ell'} \frac{V_{|\ell - \ell'|}}{4} (1 - X_\ell)(1 - X_{\ell'})$$



Identify hard core bosons with a qubit X, Y, Z

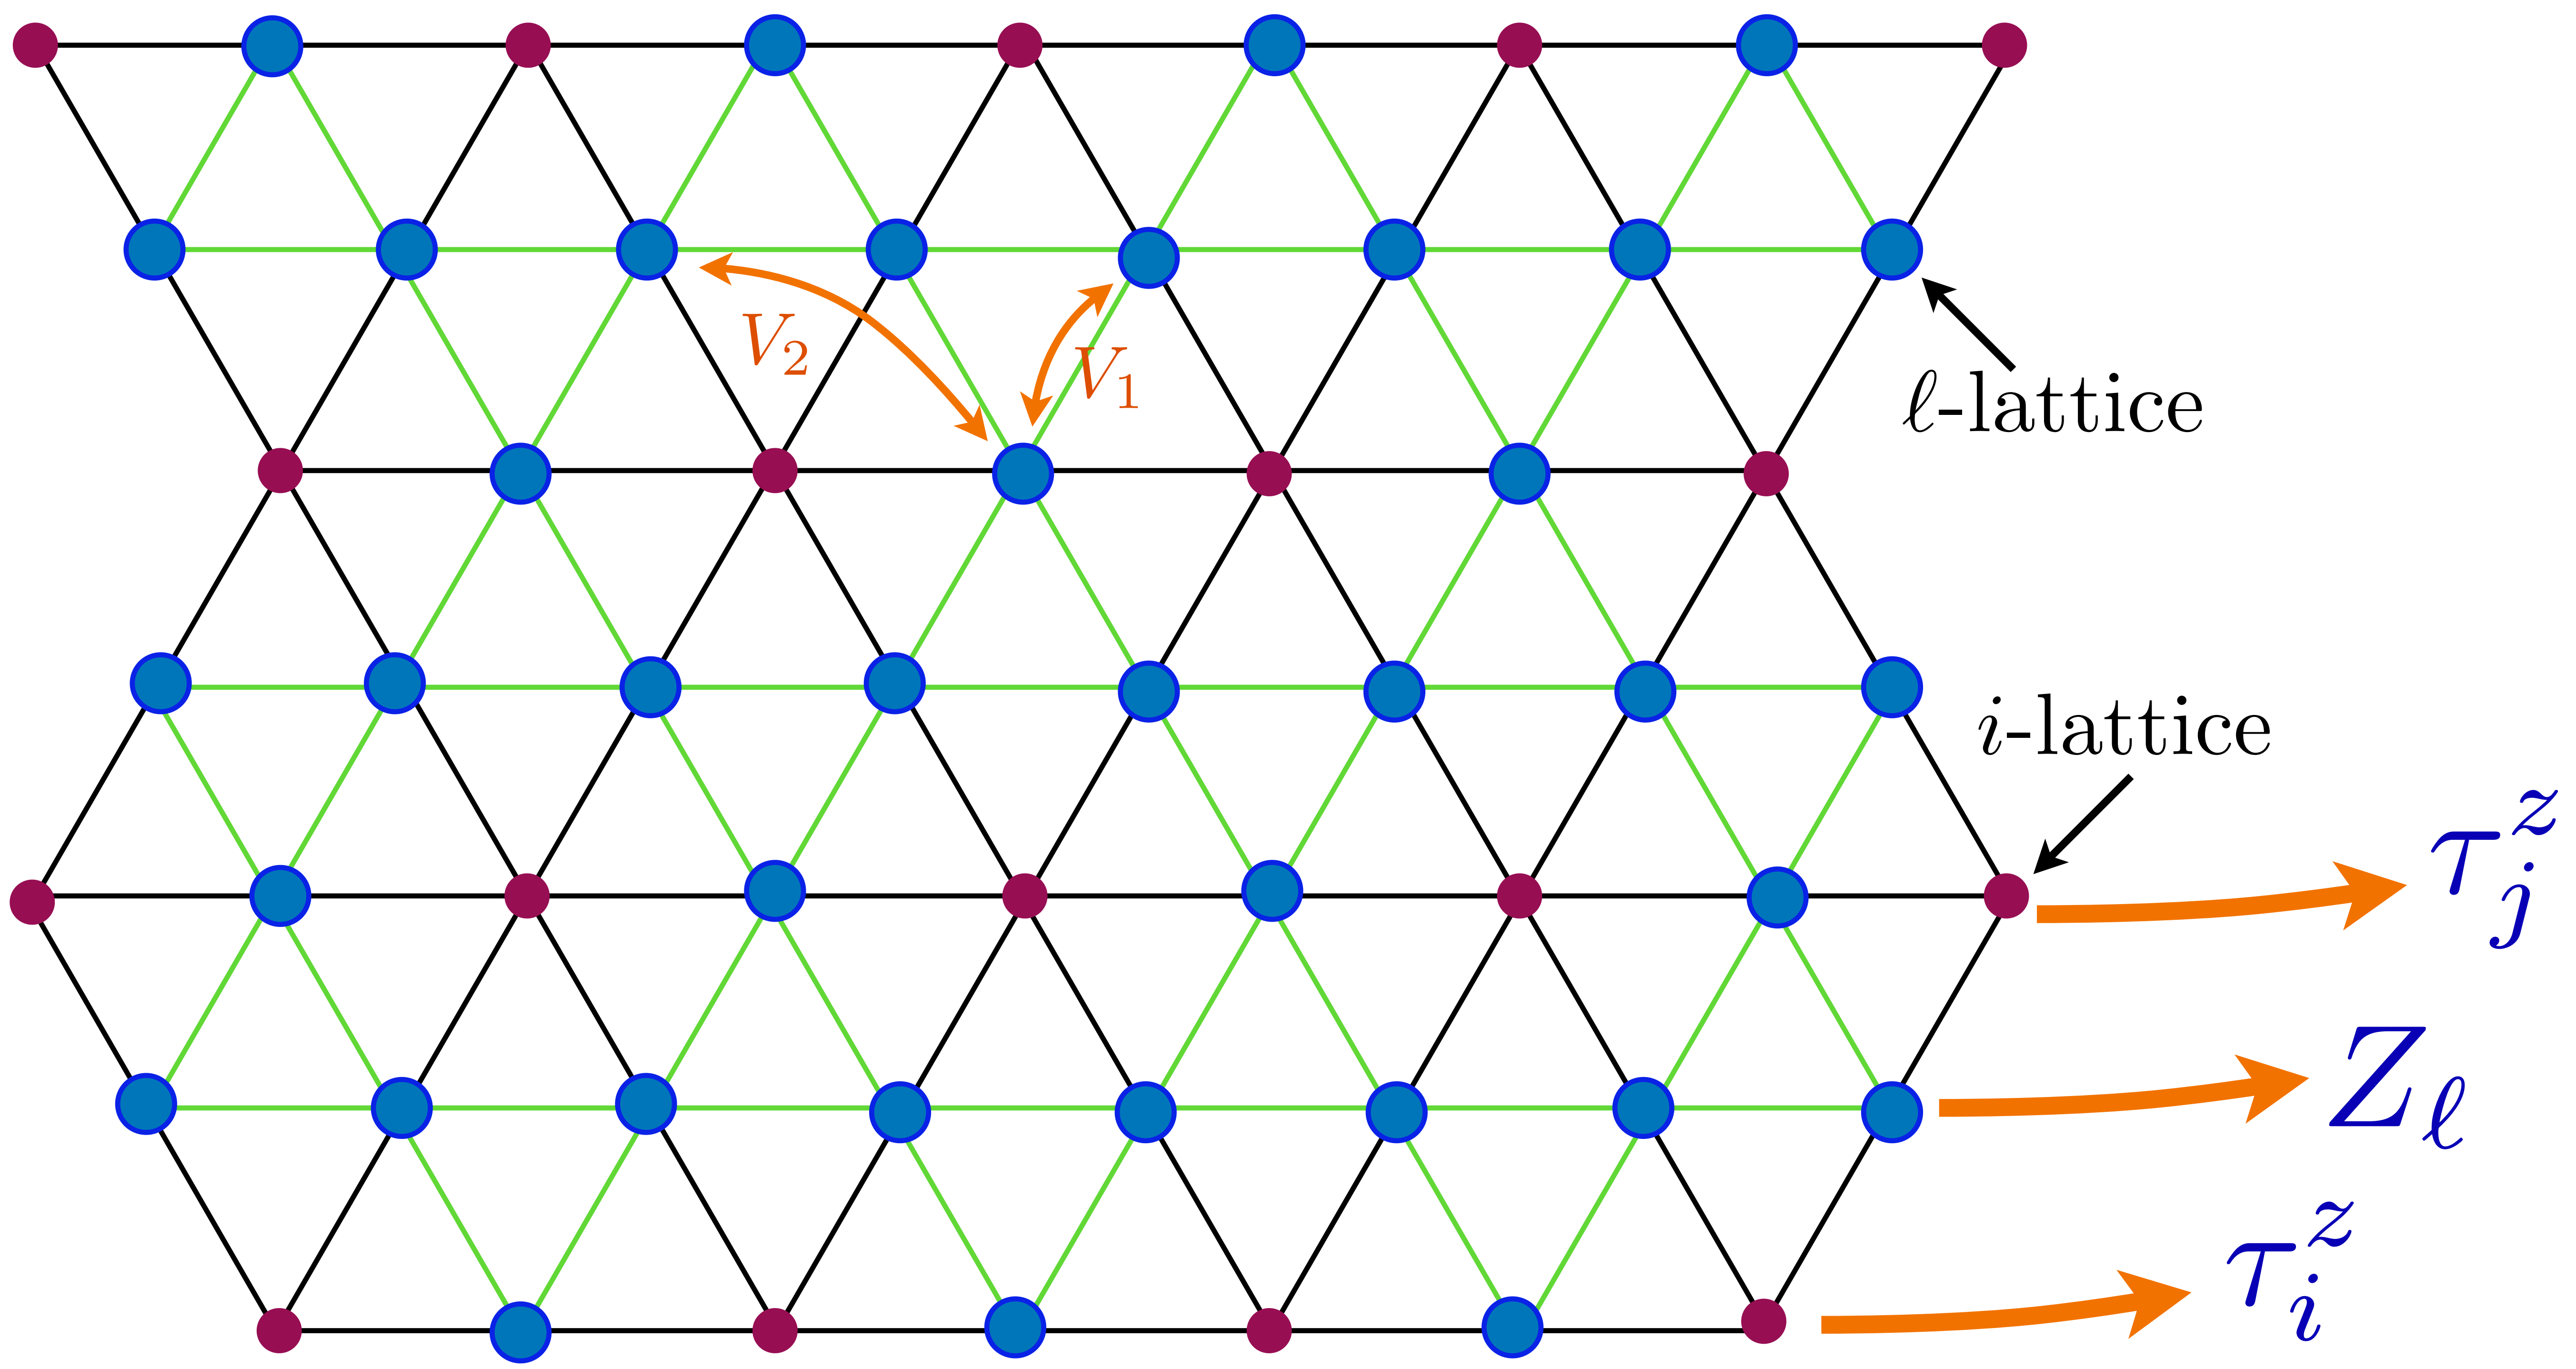
$$b_\ell + b_\ell^\dagger \quad \Leftrightarrow \quad Z_\ell$$
$$n_\ell \quad \Leftrightarrow \quad (1 - X_\ell)/2$$

Z will become the $\mathbb{Z}_2$ gauge field

From the FSS model to an emergent $\mathbb{Z}_2$ gauge theory

$$\mathcal{H} = \sum_{\ell \in (i,j)} \left[\frac{\Omega}{2} \tau_i^z \, Z_\ell \, \tau_j^z + \frac{\Delta}{2} X_\ell \right] + \sum_{\ell < \ell'} \frac{V_{|\ell - \ell'|}}{4} (1 - X_\ell)(1 - X_{\ell'})$$

Introduce $\mathbb{Z}_2$ matter fields on 'i sites'. Gauge invariance: $\tau_i^z \to \varrho_i \tau_i^z$, $Z_{ij} \to \varrho_i Z_{ij} \varrho_j$, $\tau_i^x \to \tau_i^x$, $X_\ell \to X_\ell$, $\varrho_i = \pm 1$. Gauss law constraint: $G_i = \tau_i^x \prod_{\ell \in i} X_\ell = 1$.

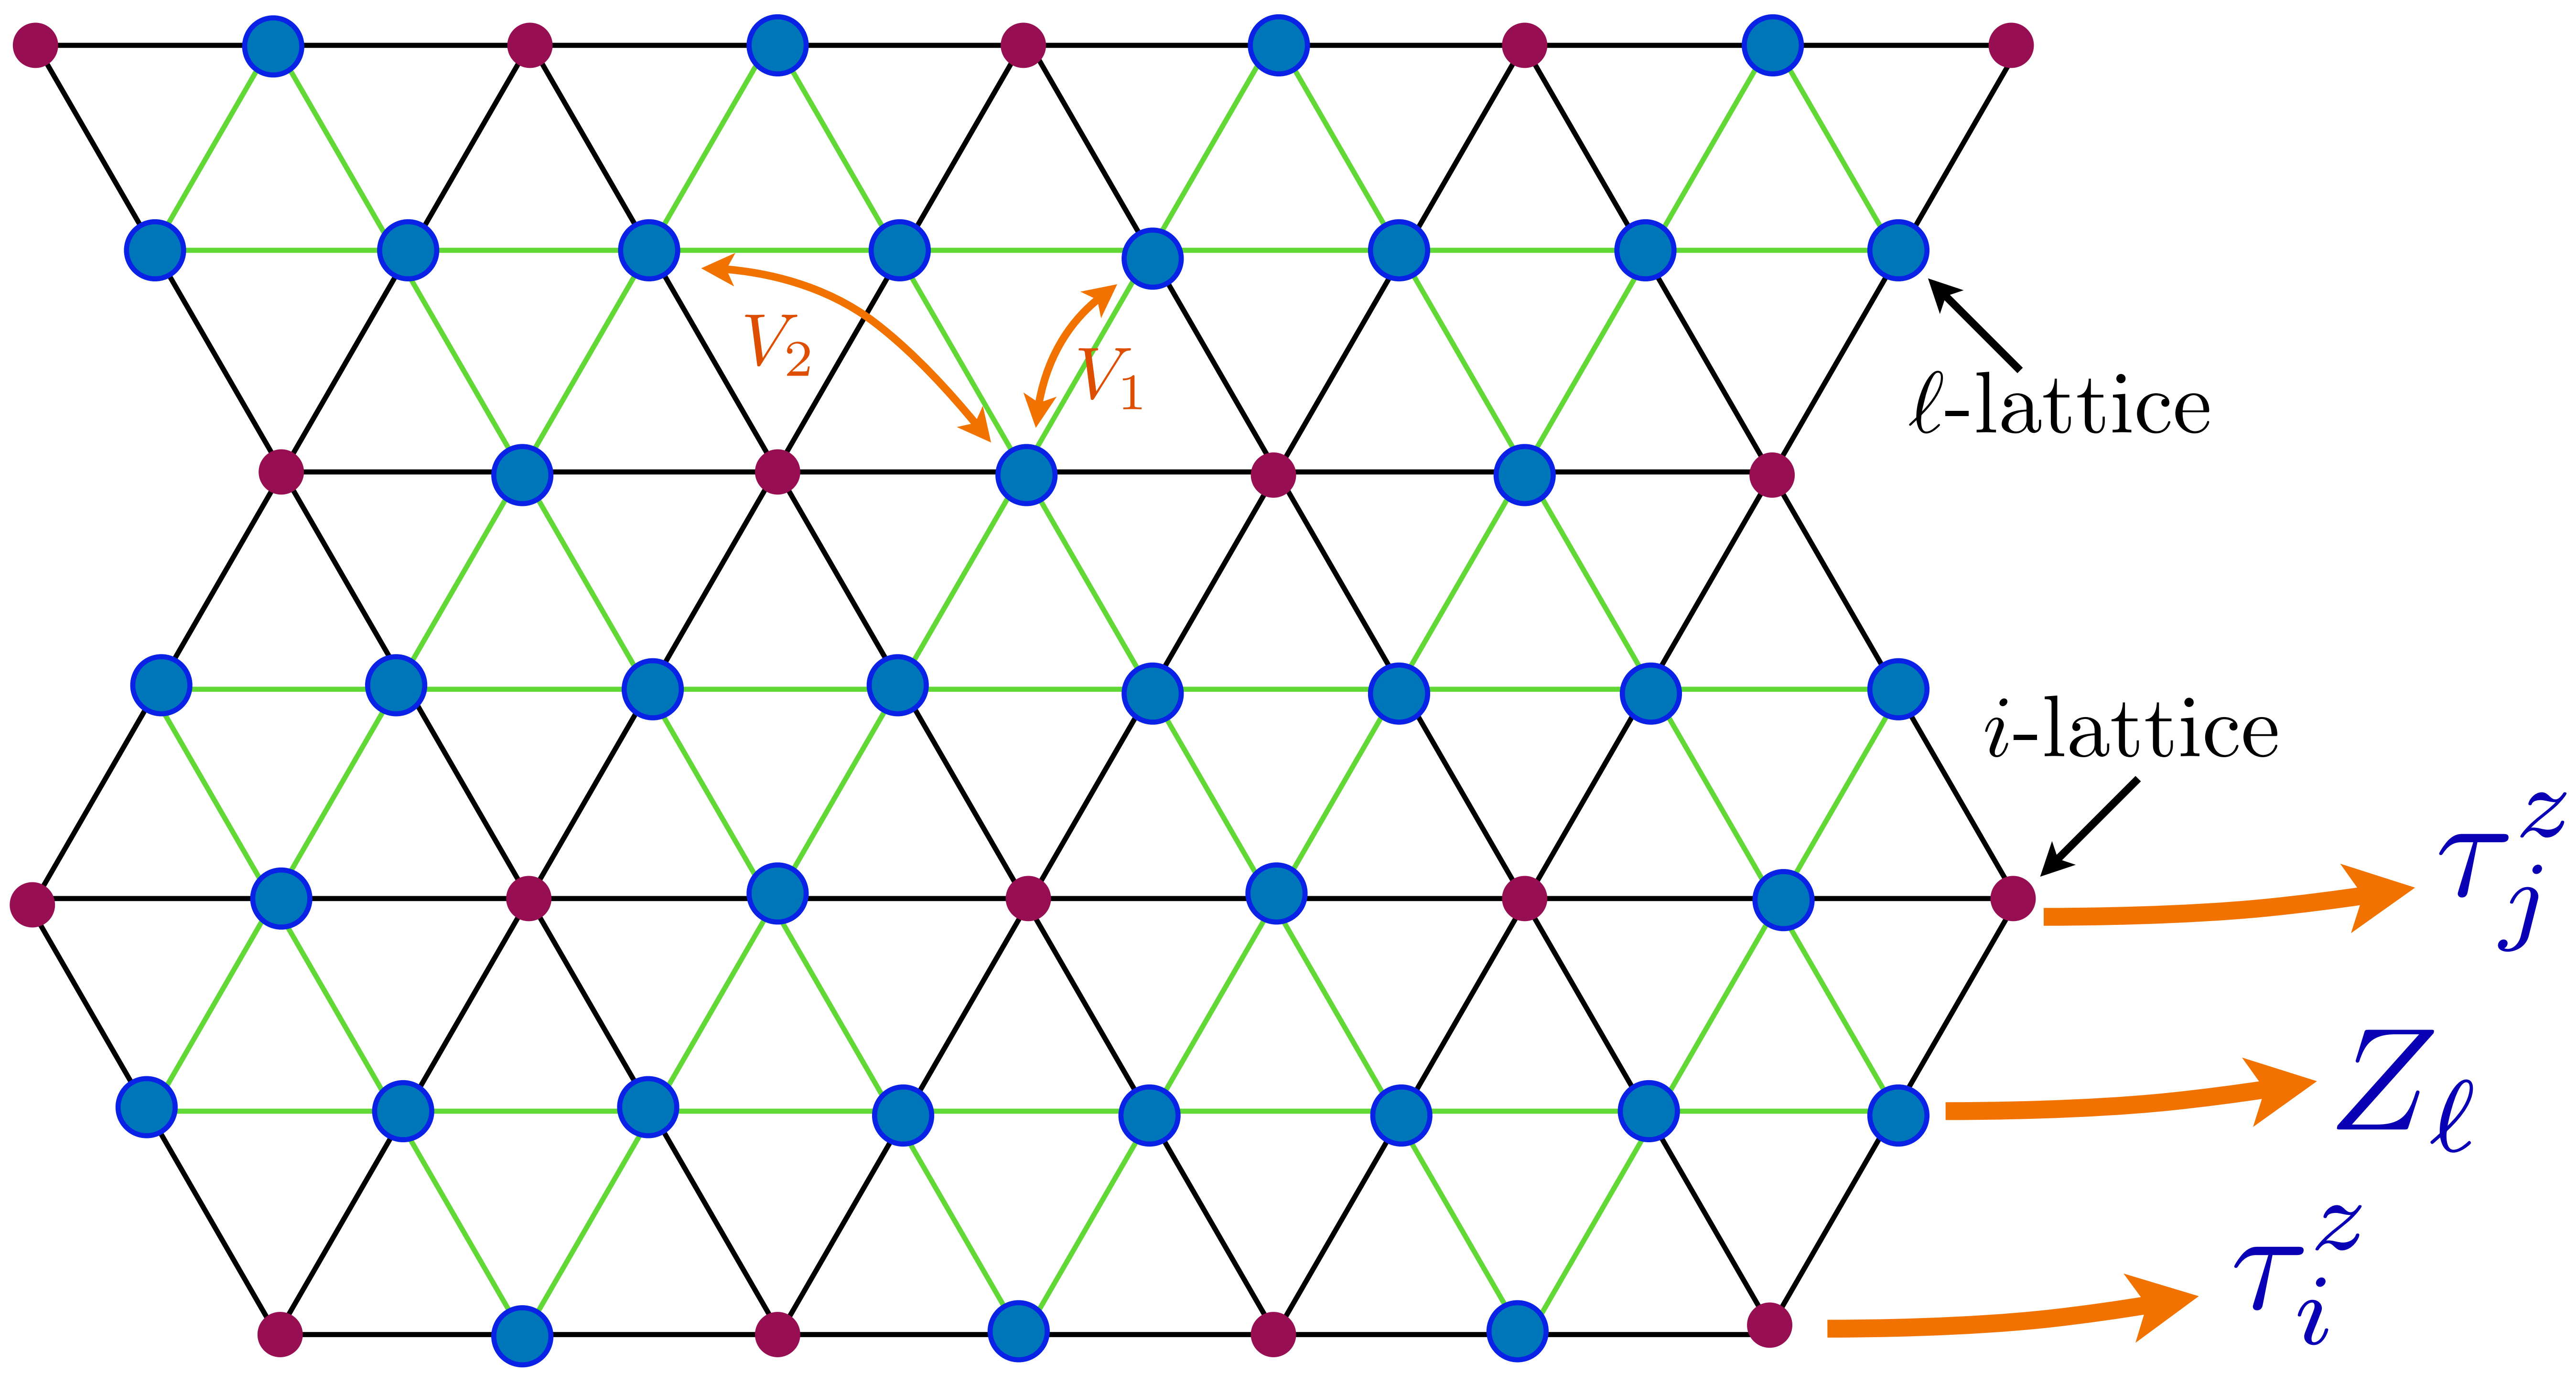


R. Samajdar, Wen Wei Ho, H. Pichler, M. D. Lukin, S. Sachdev, PNAS **118**, e2015785118 (2021)

From the FSS model to an emergent $\mathbb{Z}_2$ gauge theory

$$\mathcal{H} = \sum_{\ell \in (i,j)} \left[\frac{\Omega}{2} \tau_i^z Z_\ell \tau_j^z + \frac{\Delta}{2} X_\ell \right] + \sum_{\ell < \ell'} \frac{V_{|\ell - \ell'|}}{4} (1 - X_\ell)(1 - X_{\ell'}) - \sum_{\text{loops}} K_{\text{loop}} \prod_{\ell_1, \ell_2, \ell_3 \ldots \in \text{loop}} Z_{\ell_1} Z_{\ell_2} Z_{\ell_3} \ldots$$

The K_{loop} terms are generated in a large V expansion: 'resonance' between Rydberg states can stabilize a phase with deconfined $\mathbb{Z}_2$ gauge charges *i.e.* a $\mathbb{Z}_2$ spin liquid



R. Samajdar, Wen Wei Ho, H. Pichler, M. D. Lukin, S. Sachdev, PNAS **118**, e2015785118 (2021)

Can a FL* state
in a
single-band Hubbard model
describe the
pseudogap metal
over an intermediate
temperature range,
along with a
crossover/transition to
confinement at lower
temperatures?

Paramagnon theory of the Hubbard model

$$H = -\sum_{i<j} t_{ij} c_{i\sigma}^{\dagger} c_{j\sigma} + U \sum_i \left(n_{i\uparrow} - \frac{1}{2} \right) \left(n_{i\downarrow} - \frac{1}{2} \right) - \mu \sum_i c_{i\sigma}^{\dagger} c_{i\sigma}$$

We use the operator equation (valid on each site i):

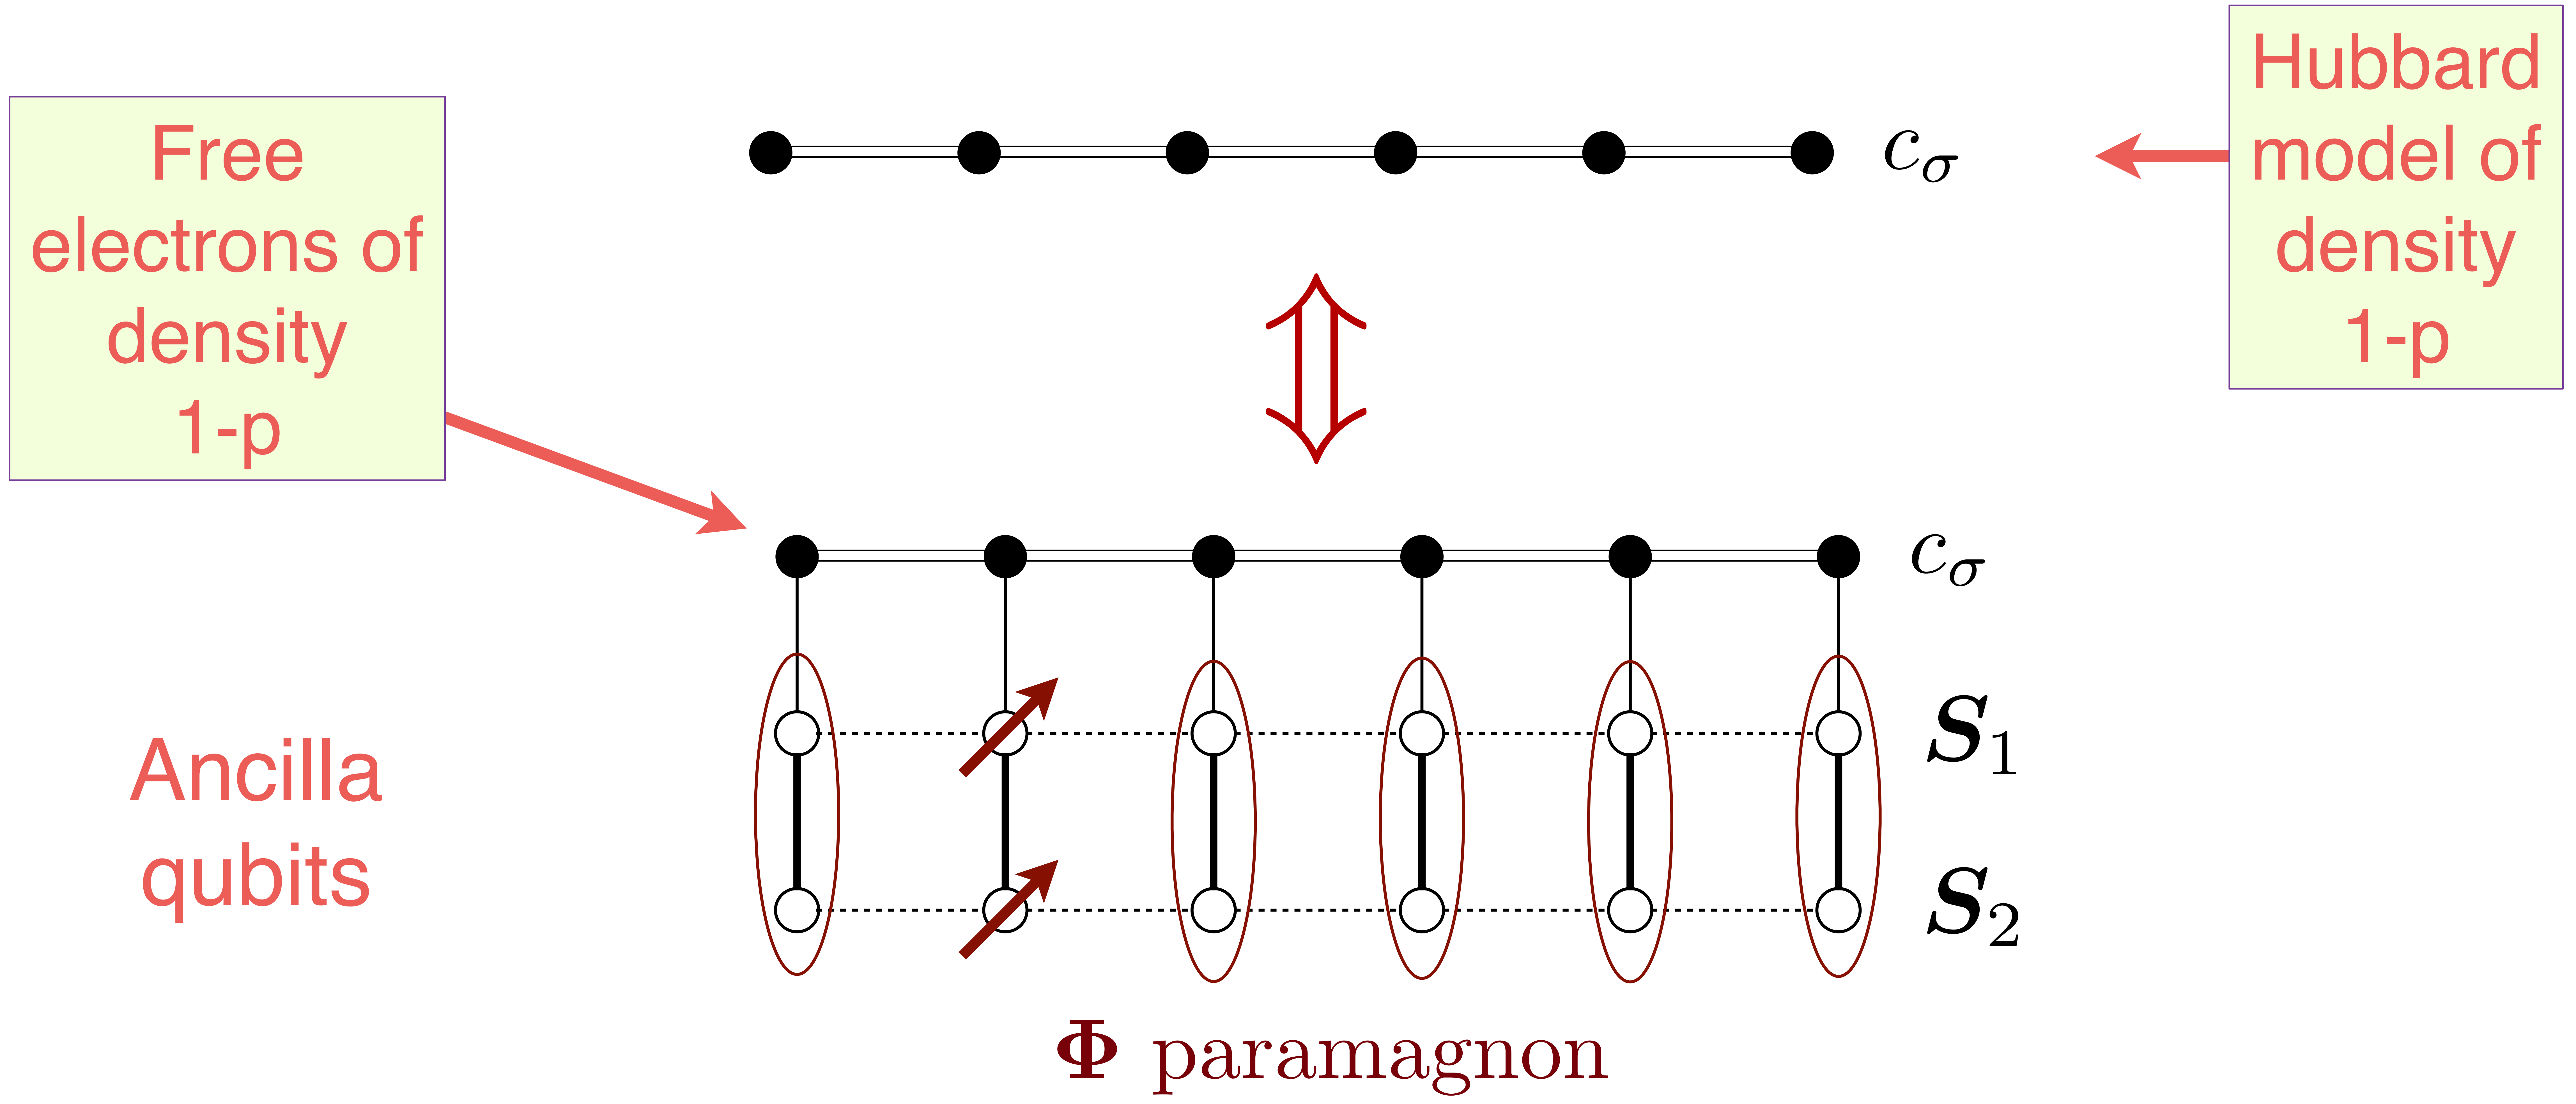
$$U \left(n_{\uparrow} - \frac{1}{2} \right) \left(n_{\downarrow} - \frac{1}{2} \right) = -\frac{2U}{3} \boldsymbol{S}^2 + \frac{U}{4}$$

Then we decouple the interaction via

$$\exp\left(\frac{2U}{3} \sum_i \int d\tau \boldsymbol{S}_i^2 \right) = \int \mathcal{D}\boldsymbol{\Phi}_i(\tau) \exp\left(-\sum_i \int d\tau \left[\frac{3}{8U} \boldsymbol{\Phi}_i^2 - \boldsymbol{\Phi}_i \cdot c_{i\sigma}^{\dagger} \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \right] \right)$$

This yields the ‘Scalapino-Pines-Chubukov-Schmalian...’ theory for a ‘paramagnon quantum rotor’ $\boldsymbol{\Phi}_i$ coupled to otherwise free fermions $c_{i\sigma}$.

Paramagnon theory of the Hubbard model

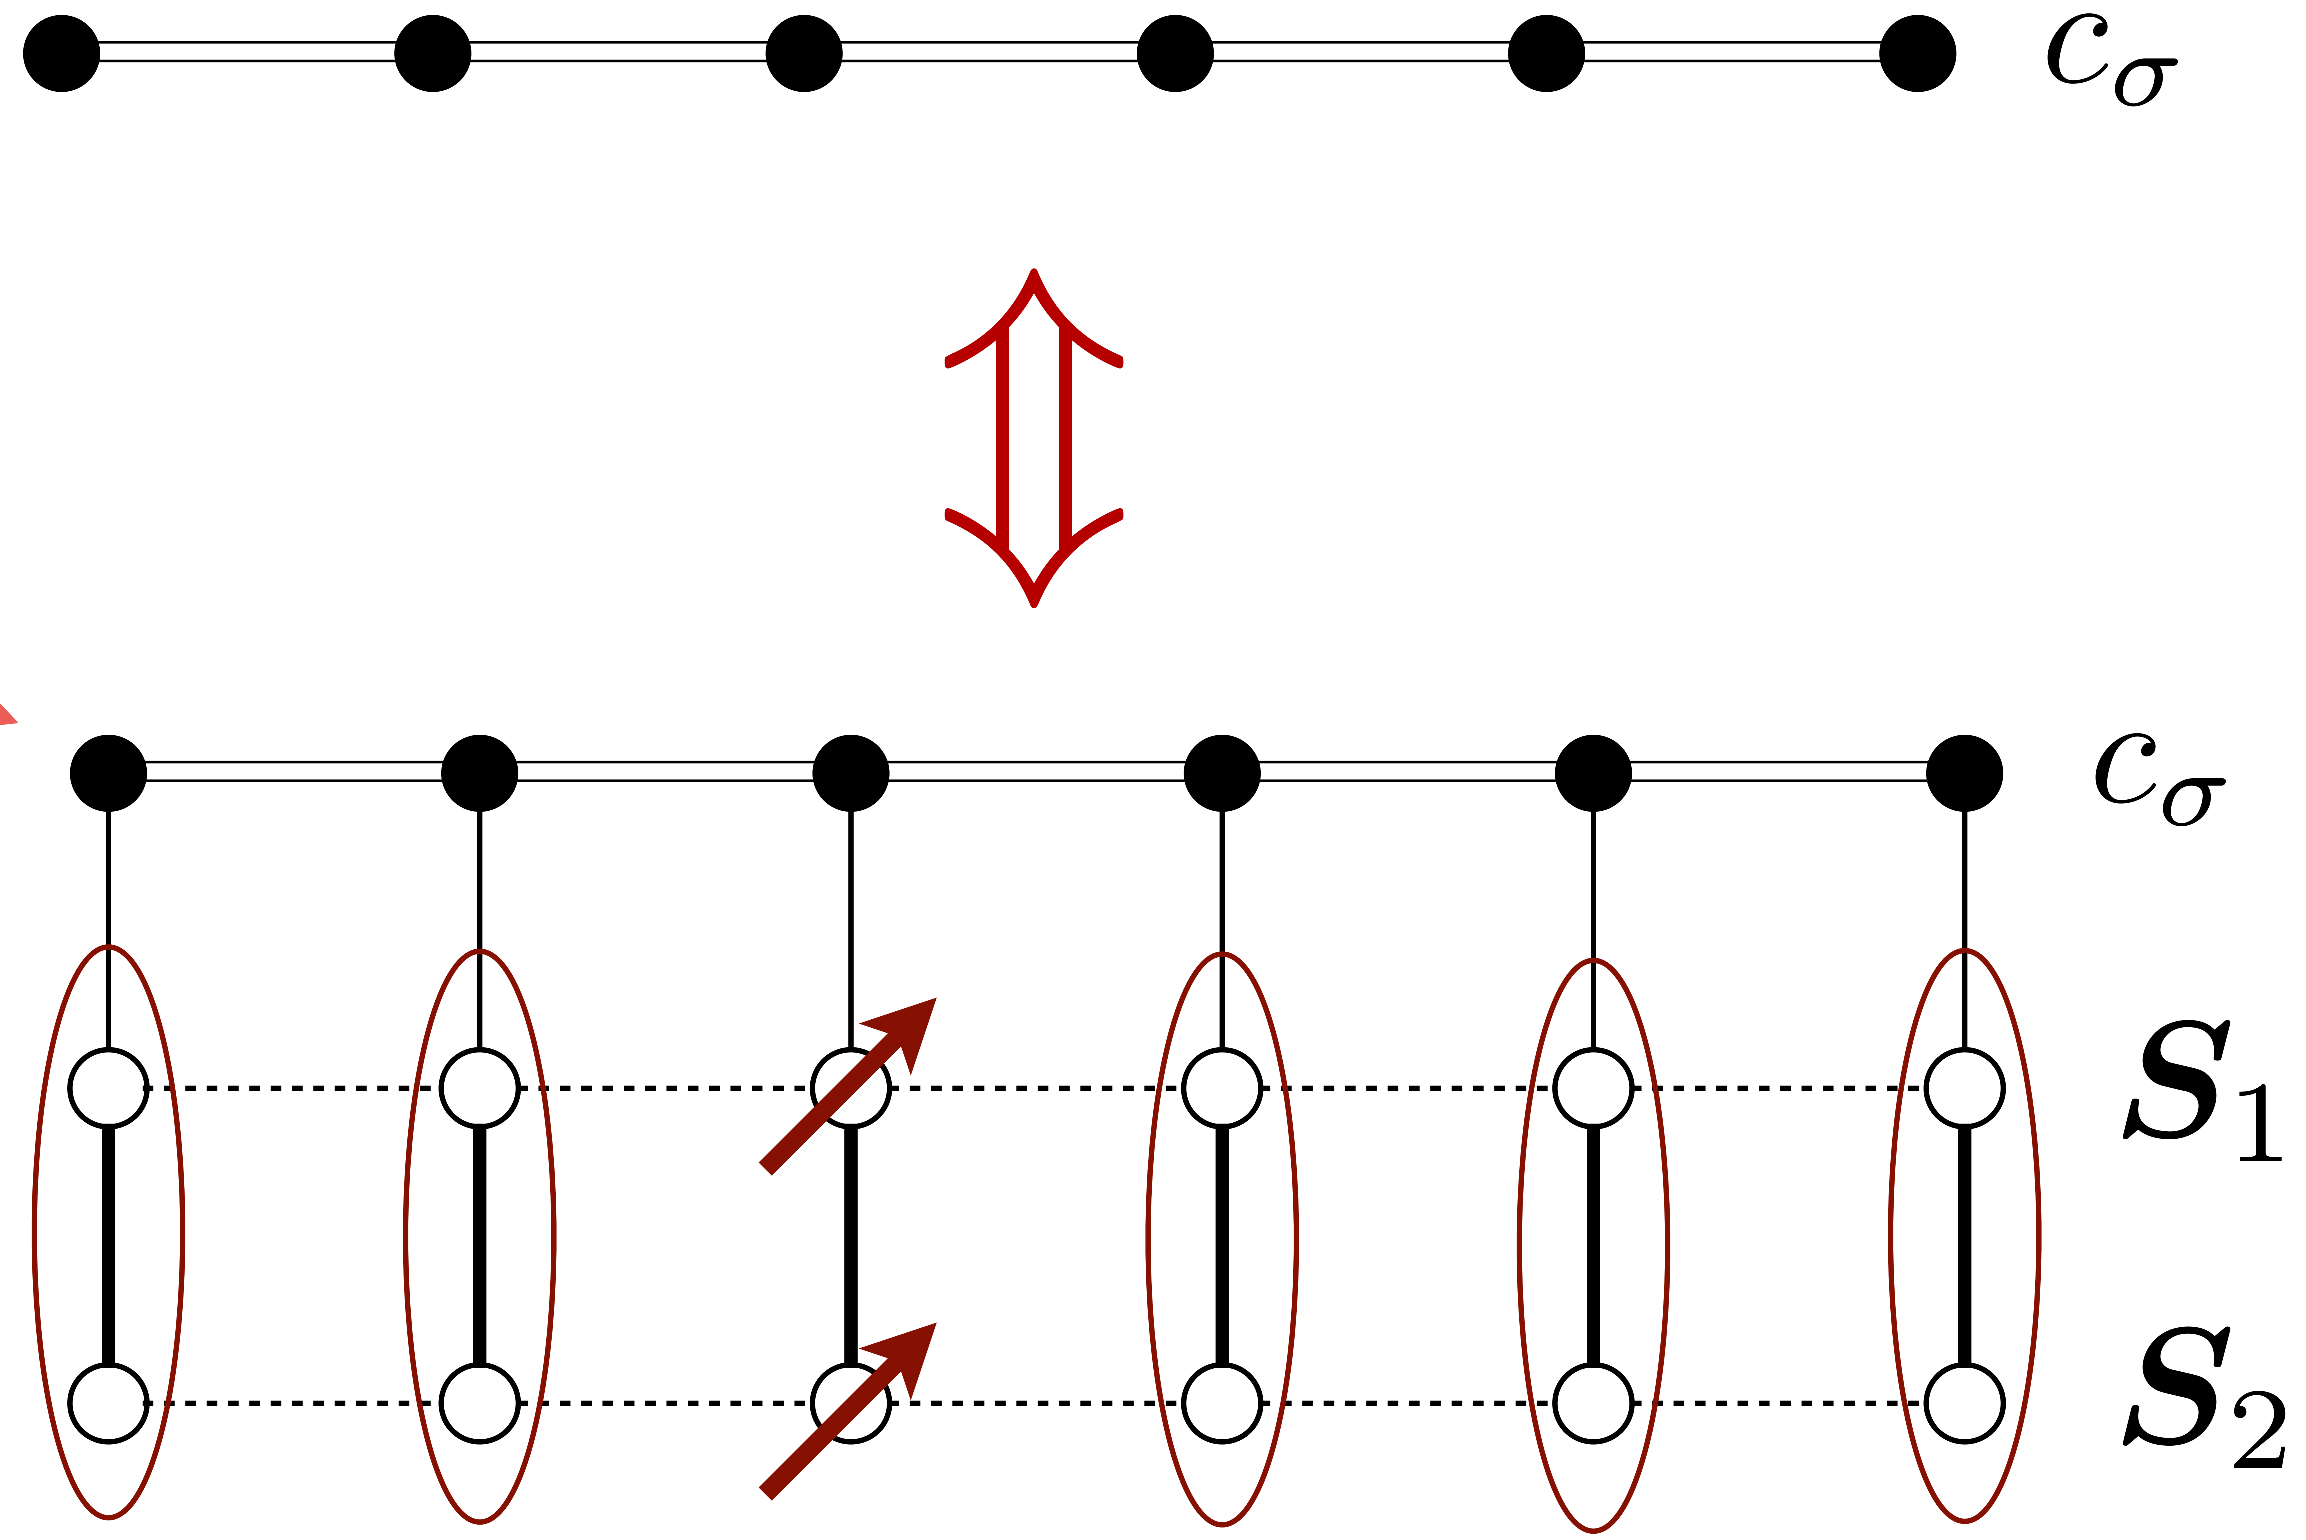


$$\mathcal{H}_{\text{paramagnon}} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c^\dagger_{\mathbf{p}\sigma} c_{\mathbf{p}\sigma} - \lambda \sum_i c^\dagger_{i\sigma} \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{\Phi}_i + \dots$$

Paramagnon theory of the Hubbard model

Free electrons of density 1-p

Hubbard model of density 1-p



Ancilla qubits

$\boldsymbol{\Phi}$ paramagnon

$$\mathcal{H}_{\rm paramagnon} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c_{\mathbf{p}\sigma}^\dagger c_{\mathbf{p}\sigma} - \lambda \sum_i c_{i\sigma}^\dagger \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{\Phi}_i + \ldots$$

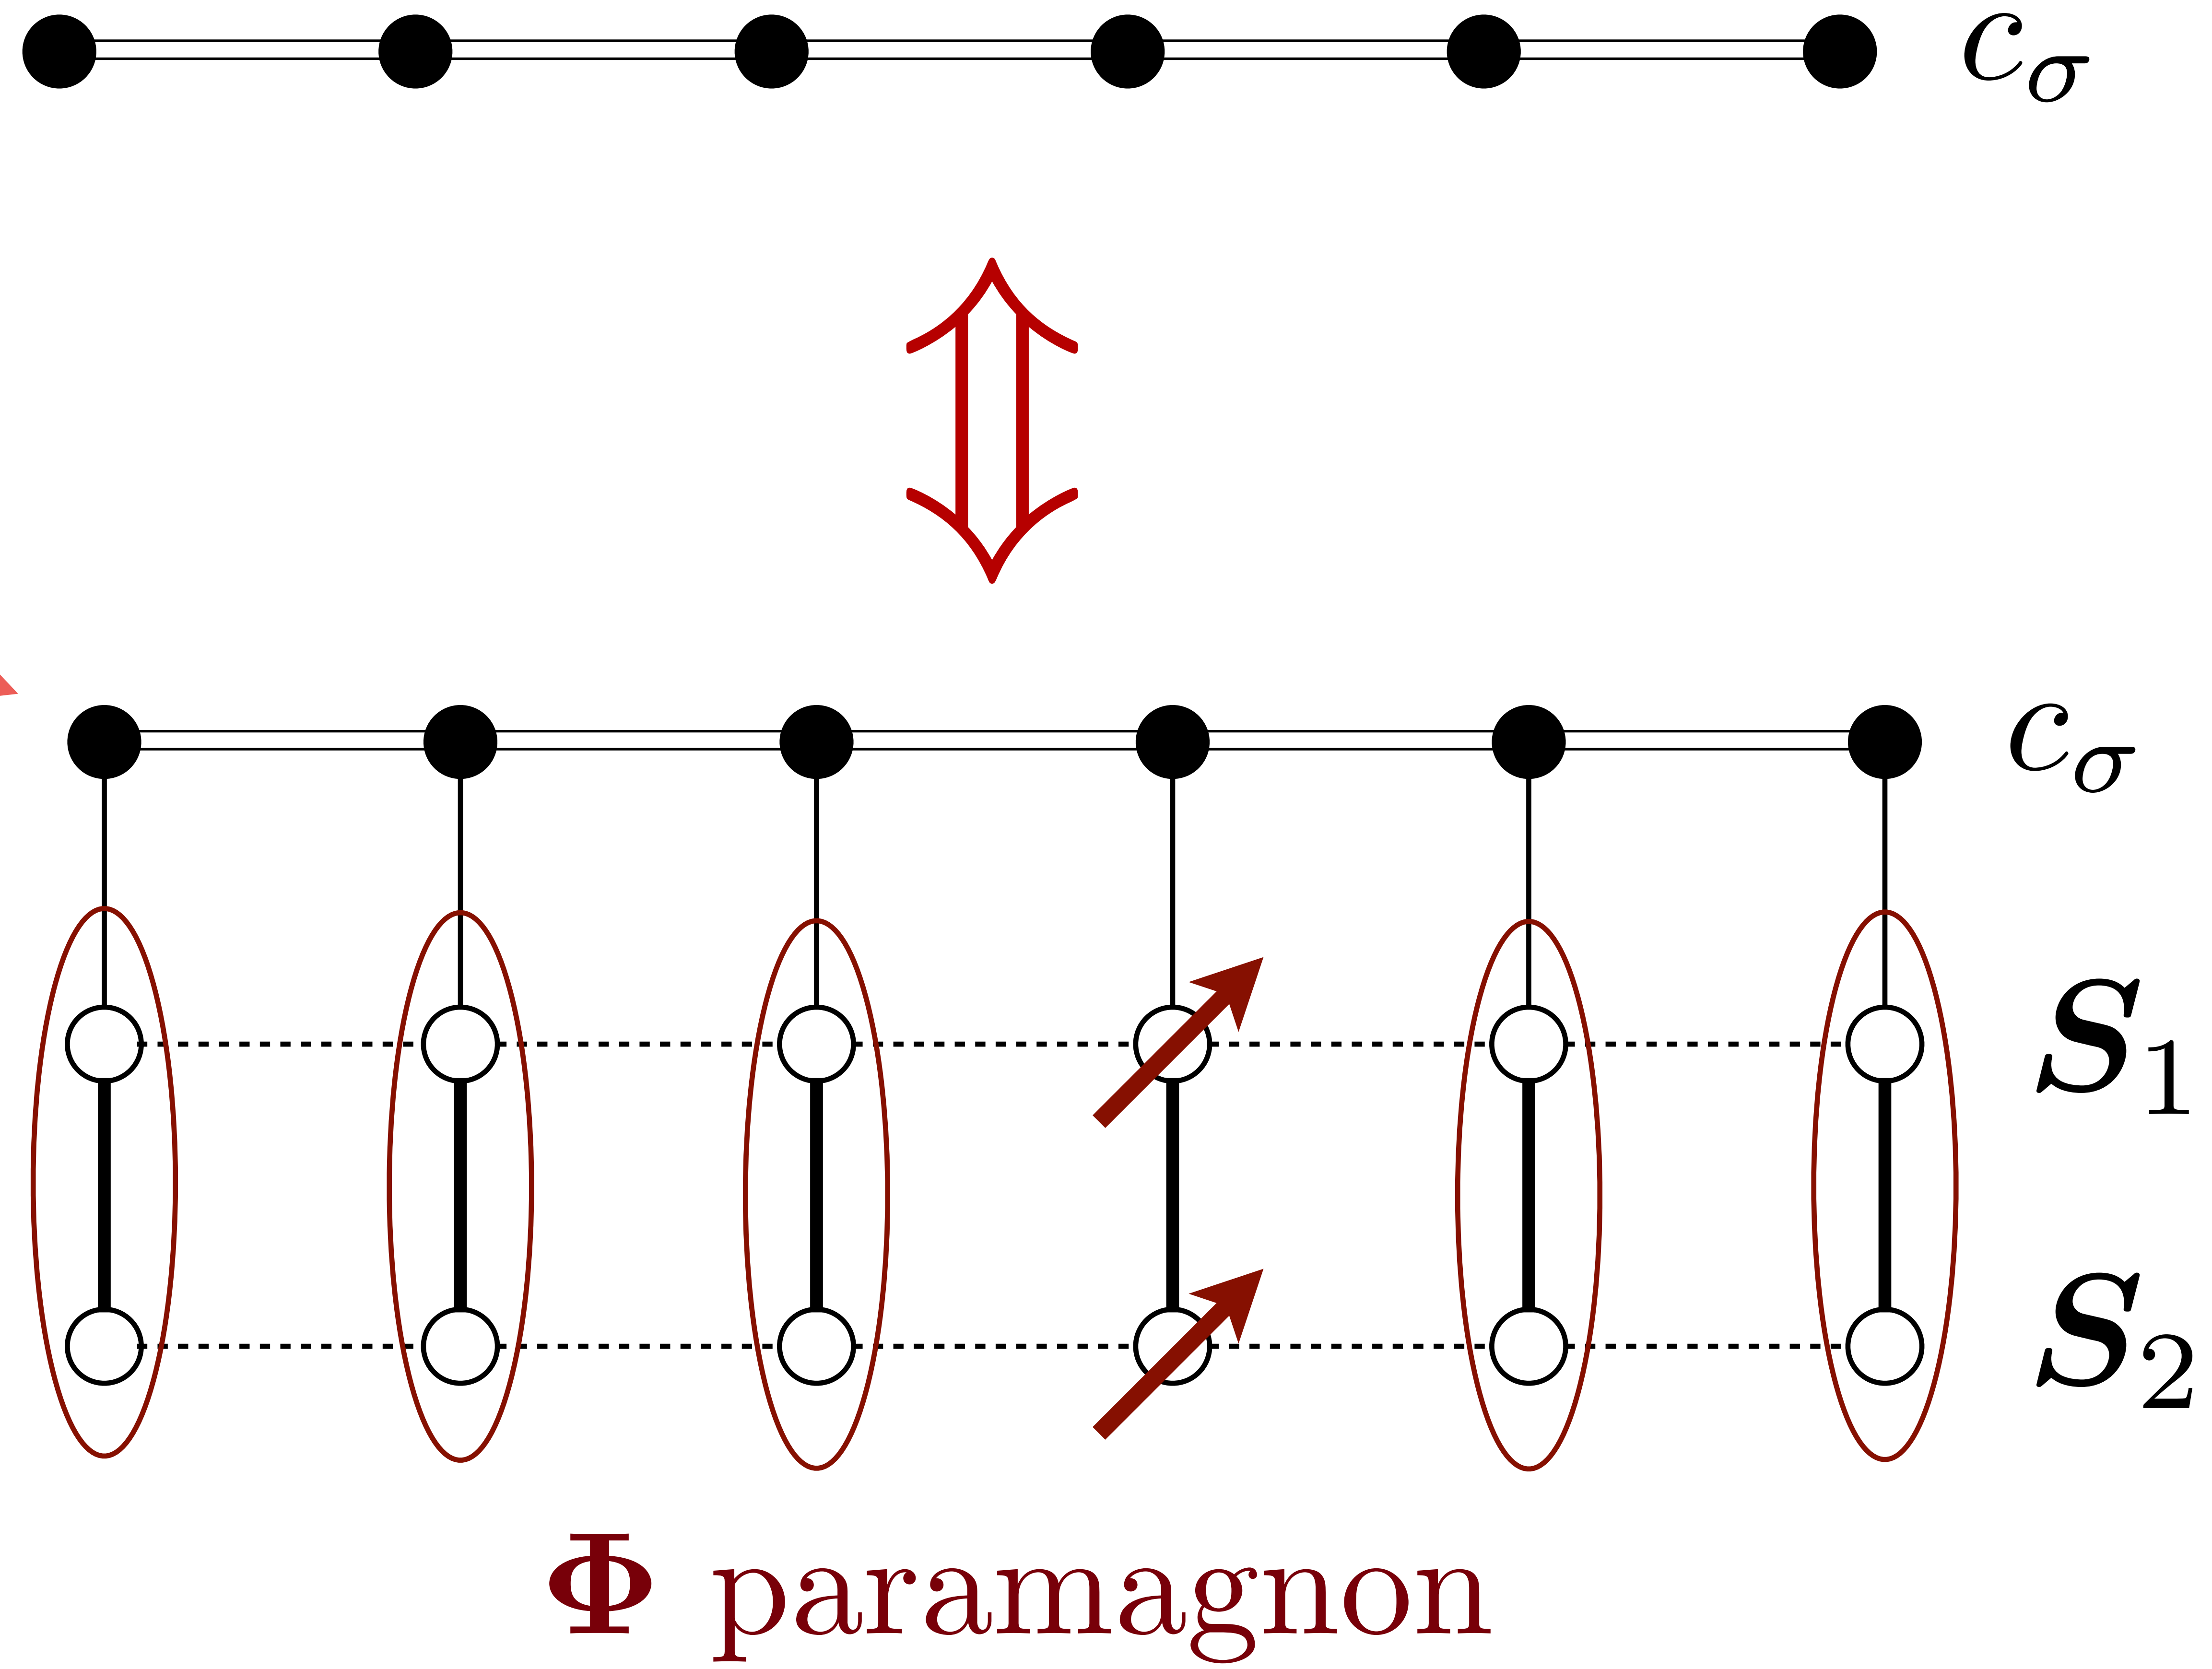
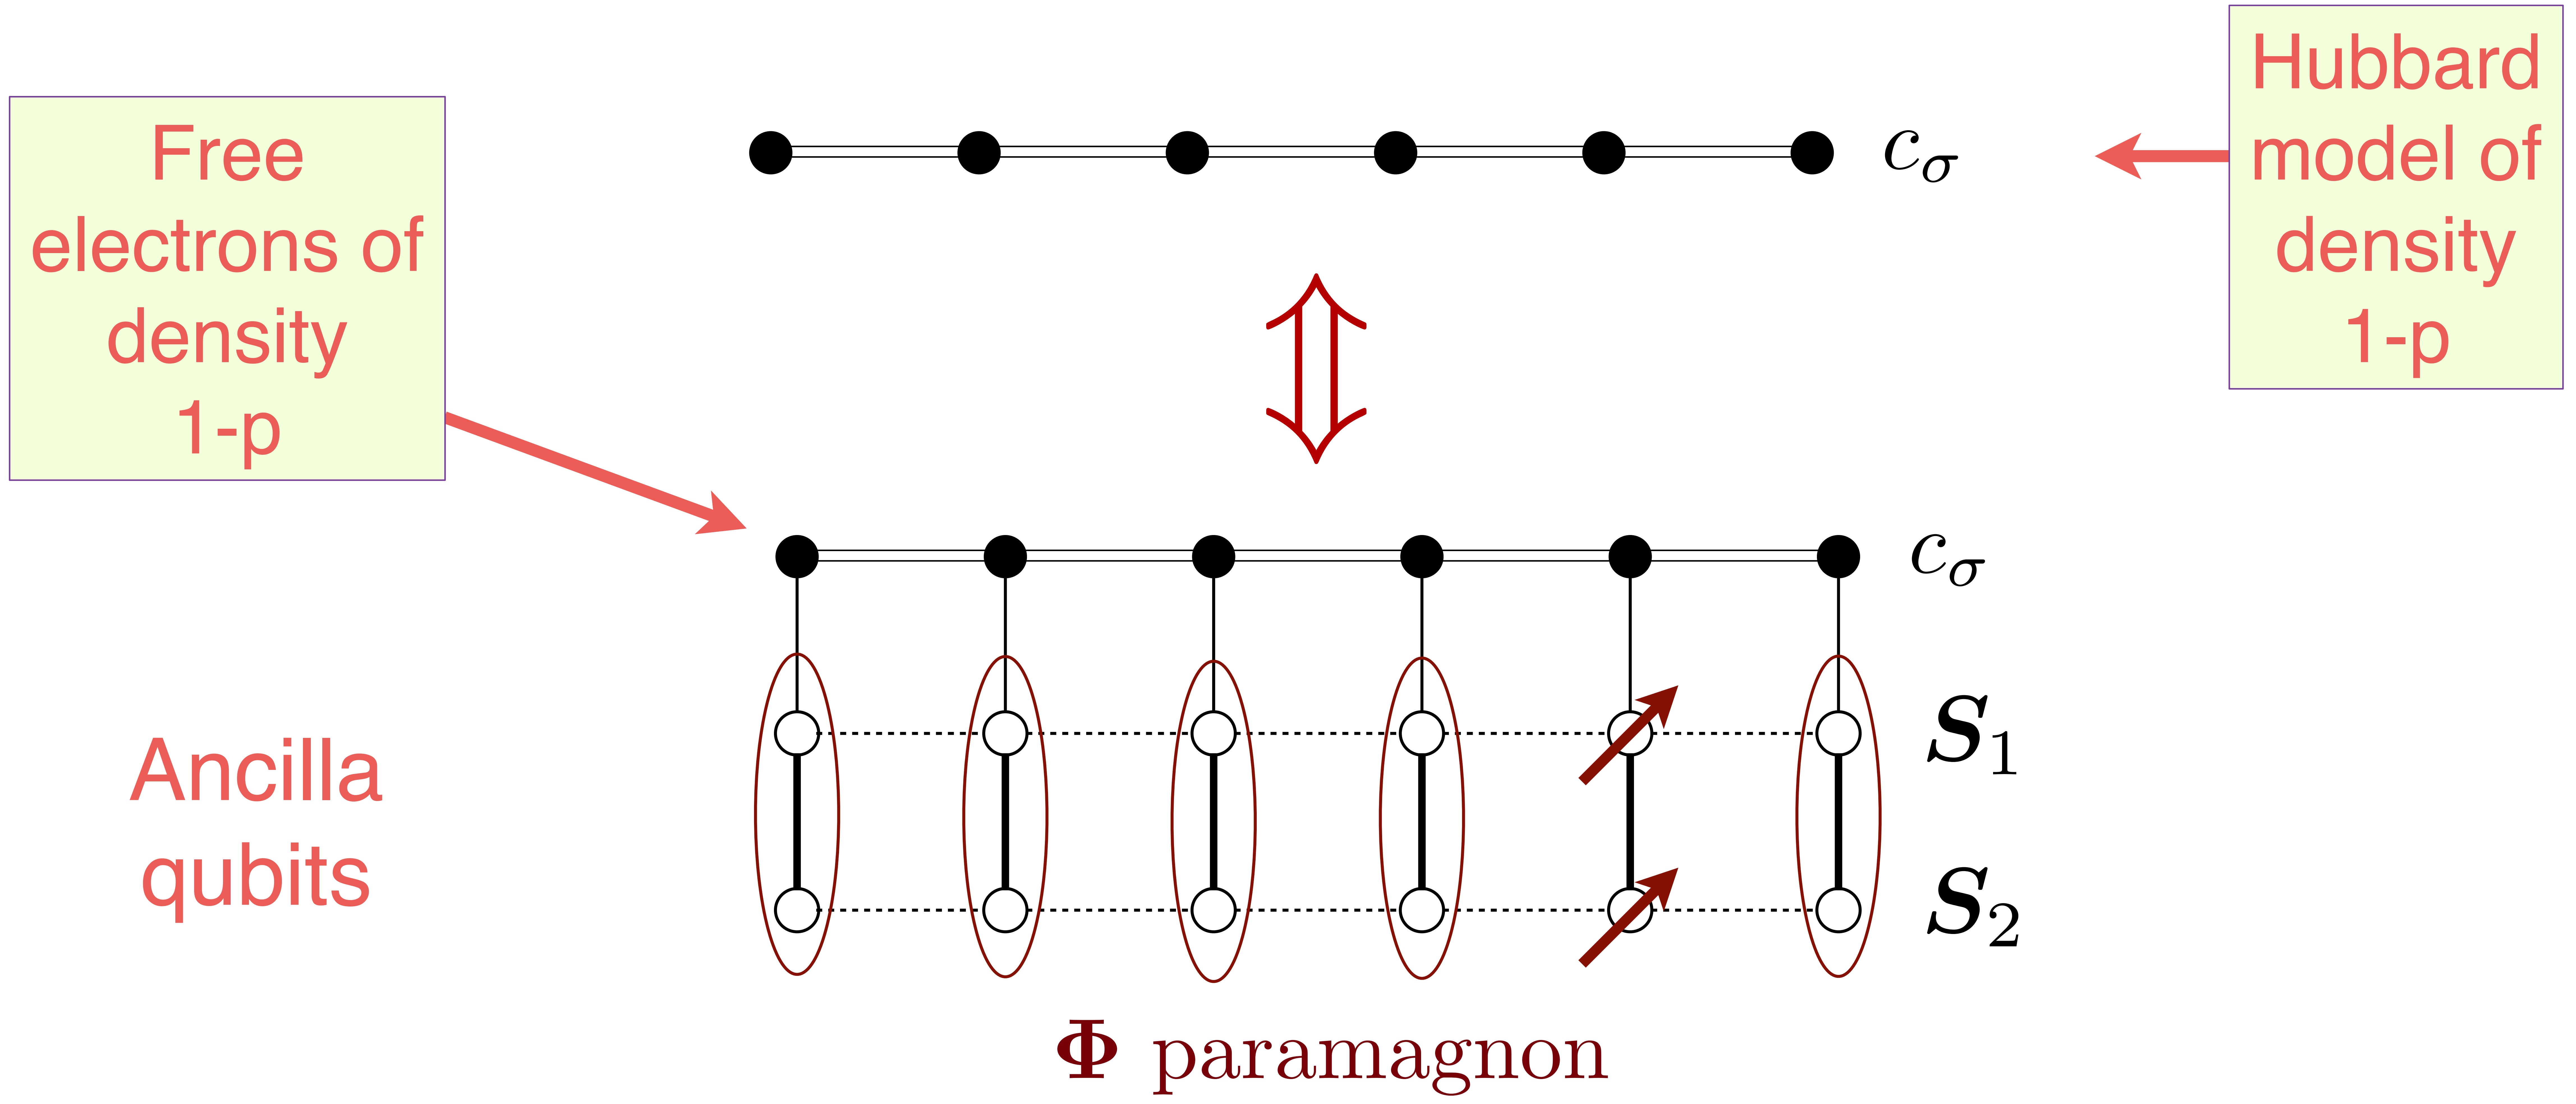
Hubbard model of density 1-p



Ancilla qubits

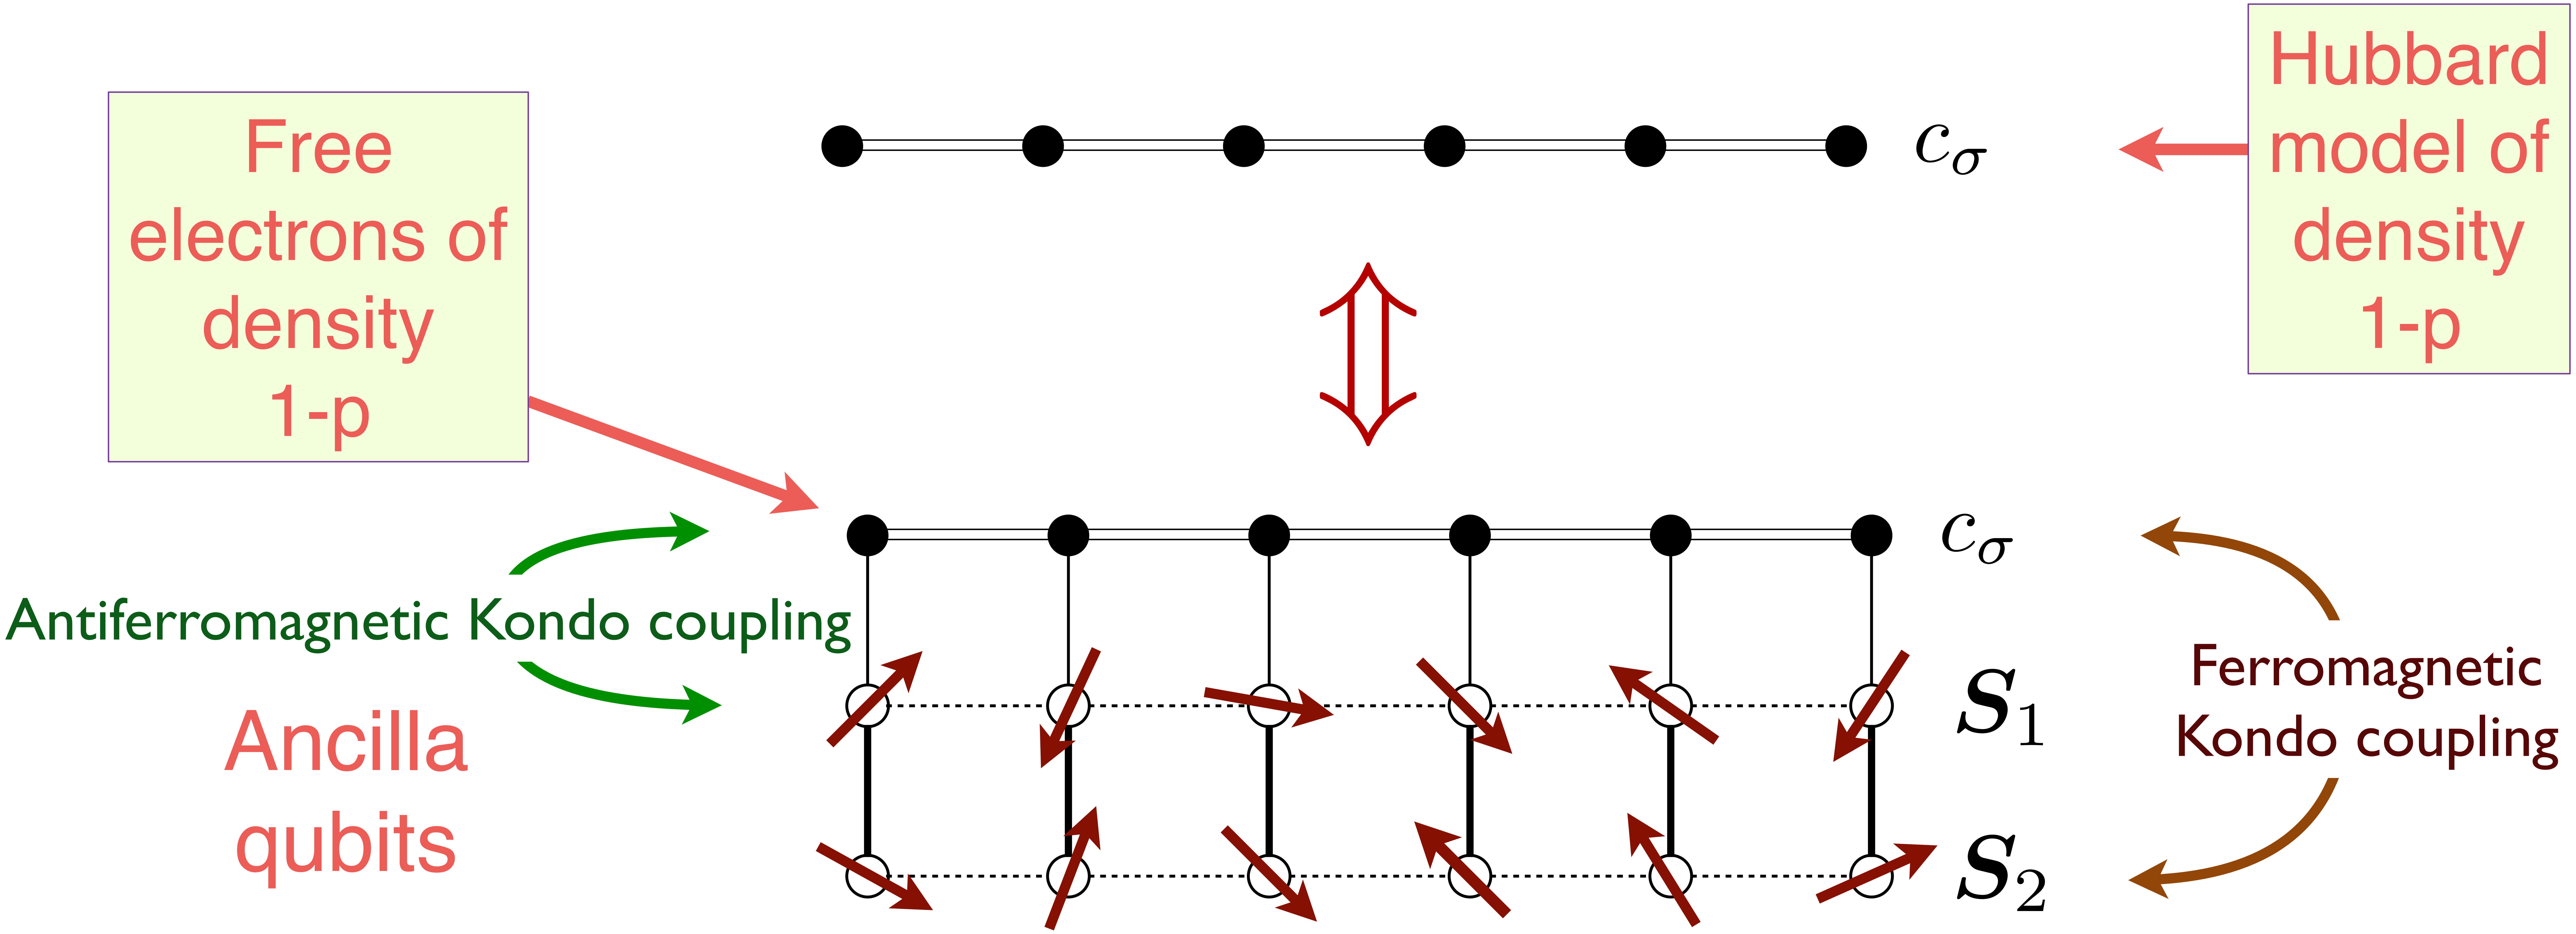
$$\mathcal{H}_{\rm paramagnon} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c^\dagger_{\mathbf{p}\sigma} c_{\mathbf{p}\sigma} - \lambda \sum_i c^\dagger_{i\sigma} \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{\Phi}_i + \ldots$$

Paramagnon theory of the Hubbard model



$$\mathcal{H}_{\rm paramagnon} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c_{\mathbf{p}\sigma}^\dagger c_{\mathbf{p}\sigma} - \lambda \sum_i c_{i\sigma}^\dagger \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{\Phi}_i + \ldots$$

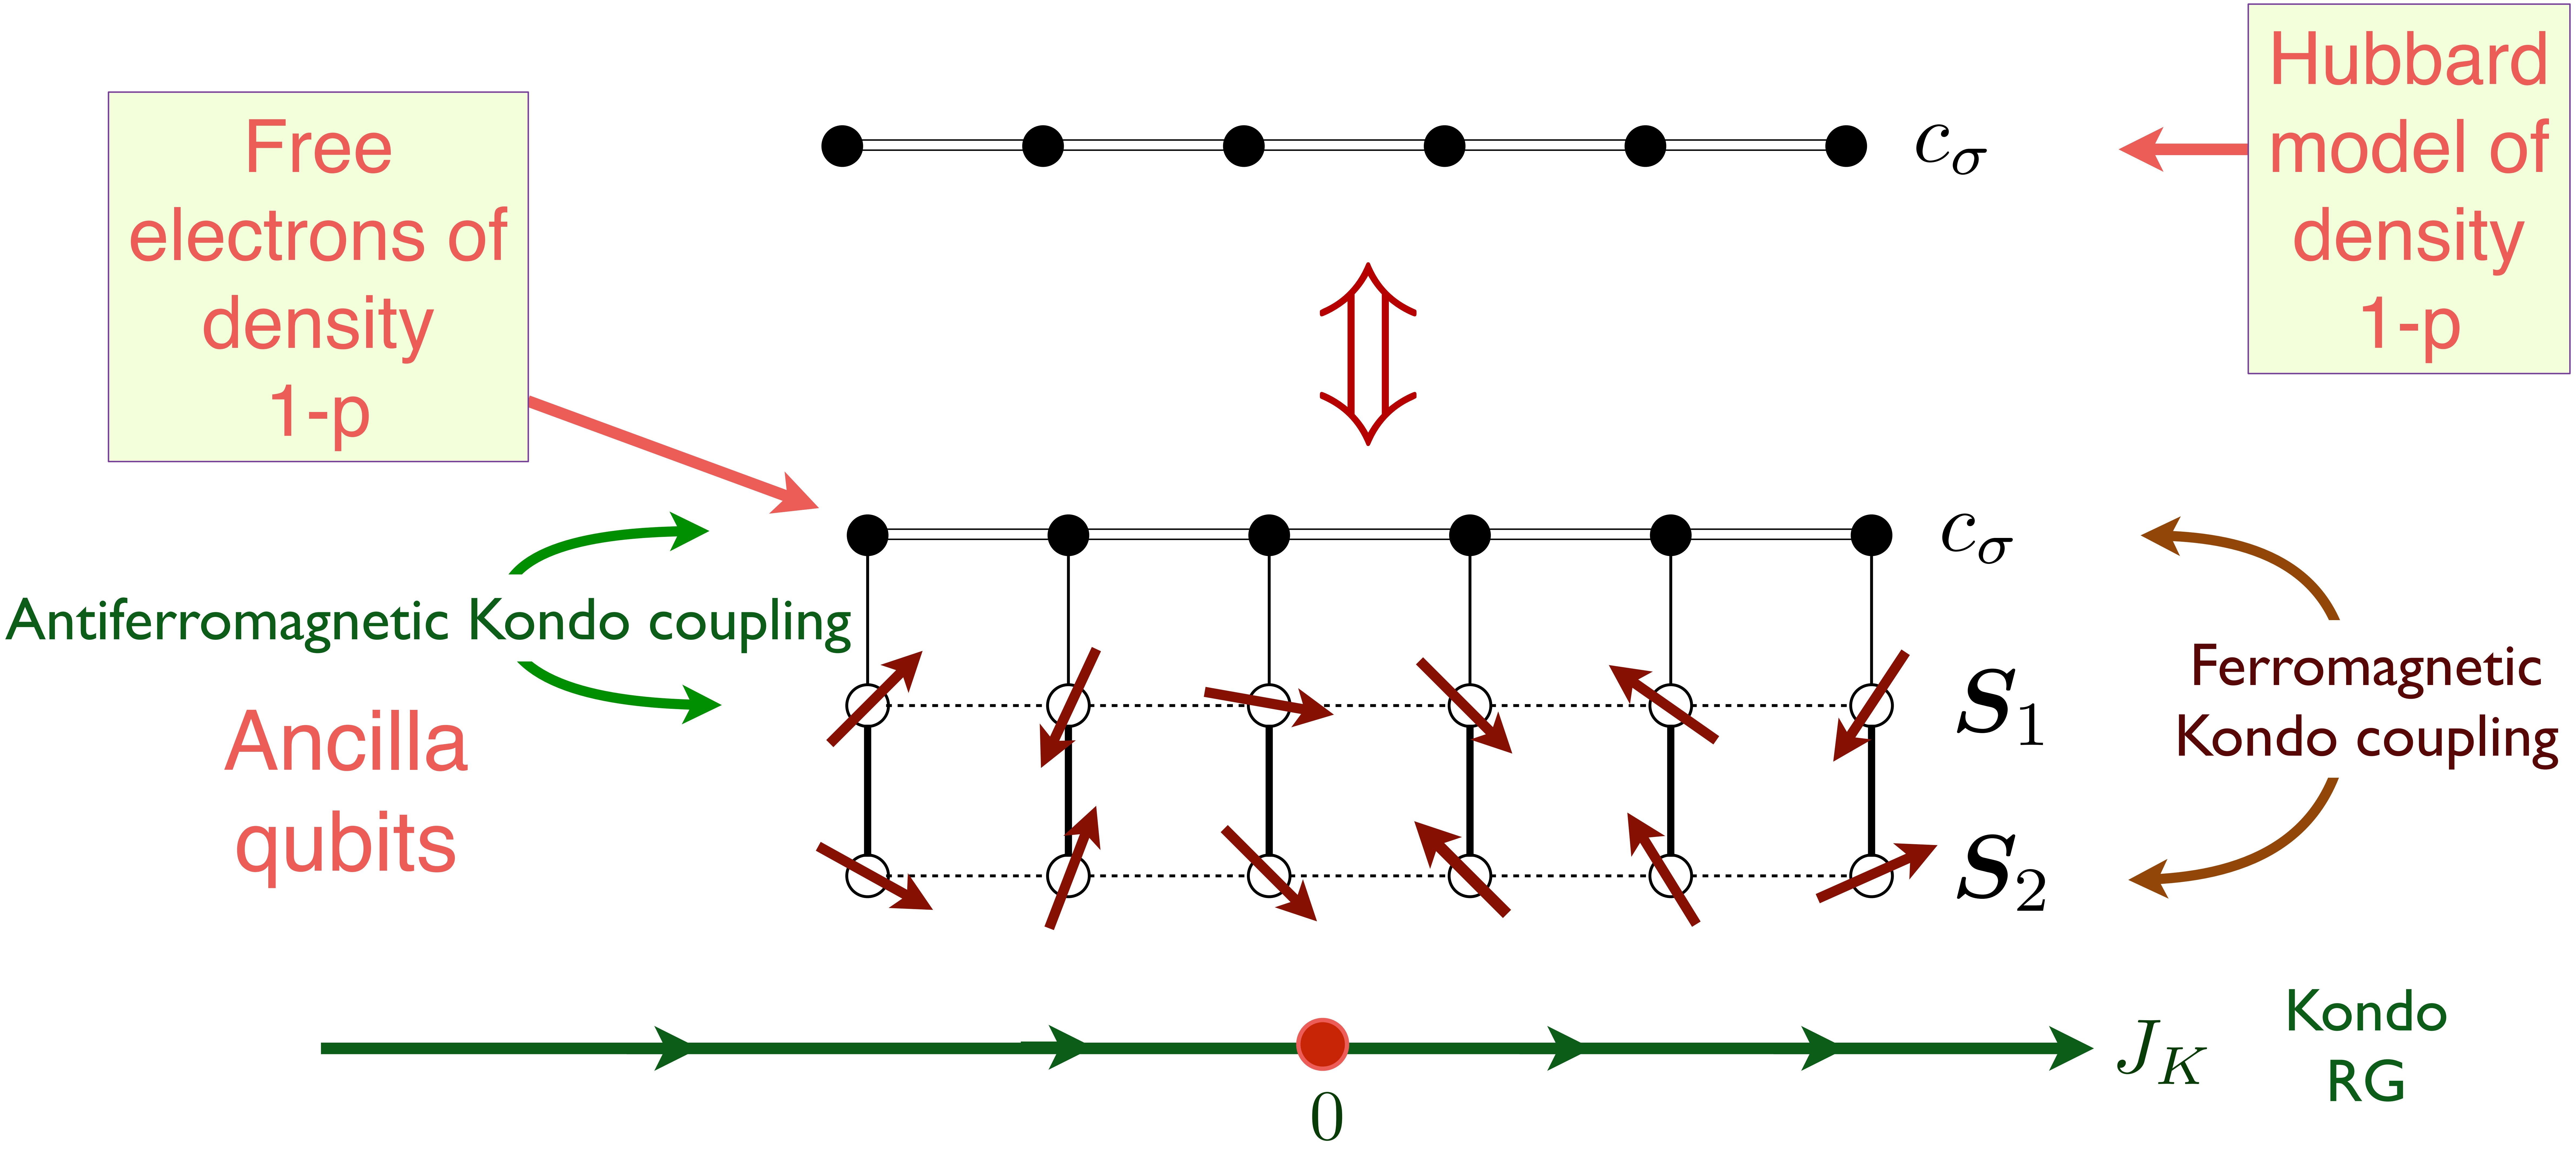
Paramagnon fractionalization theory of the Hubbard model



$$\boldsymbol{\Phi}_i = \frac{1}{\sqrt{3}} \left(\boldsymbol{S}_{2i} - \boldsymbol{S}_{1i} \right)$$

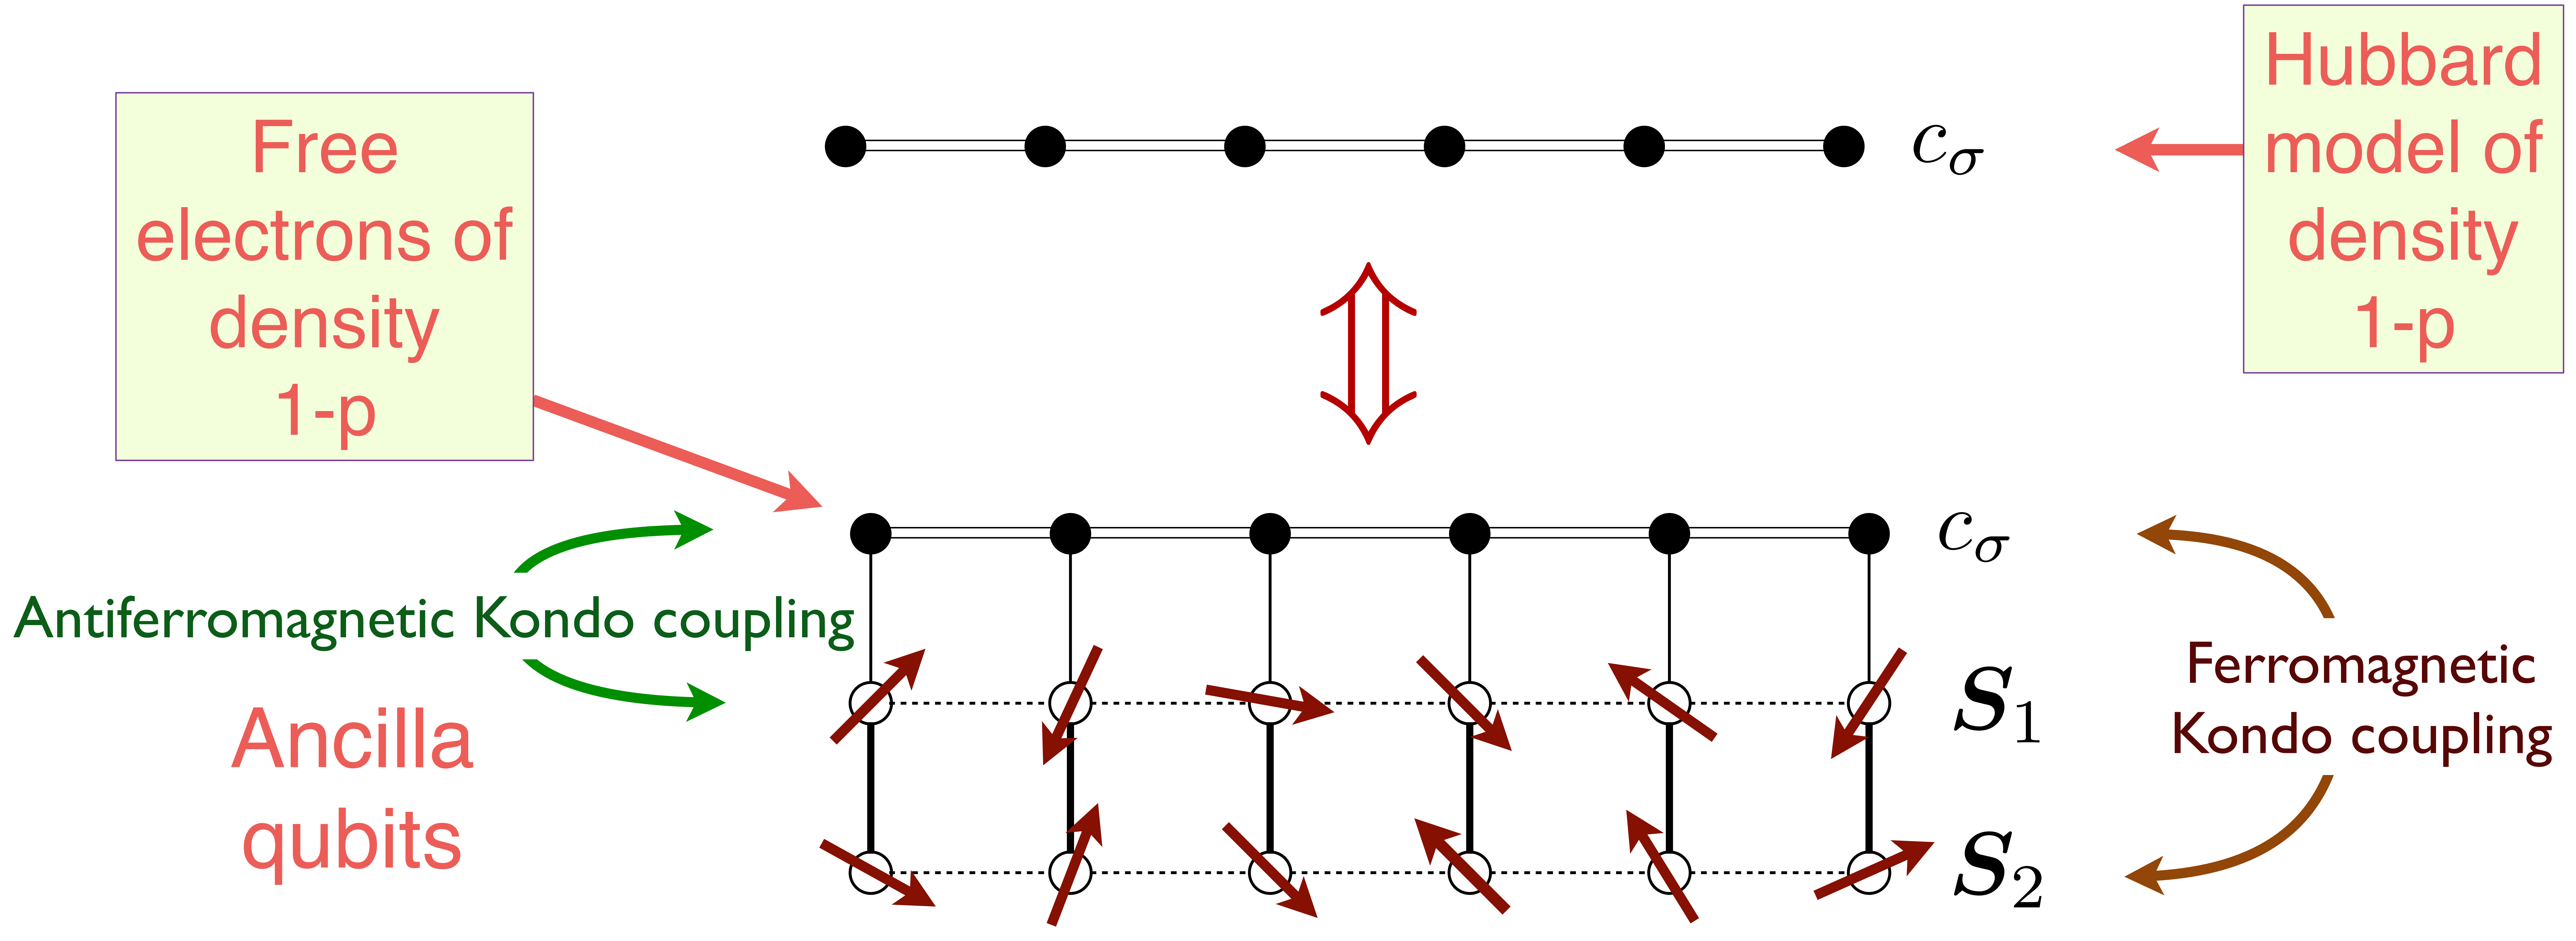
$$\mathcal{H}_{\text{paramagnon}} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c_{\mathbf{p}\sigma}^{\dagger} c_{\mathbf{p}\sigma} - \lambda \sum_i c_{i\sigma}^{\dagger} \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{\Phi}_i + \ldots$$

Paramagnon fractionalization theory of the Hubbard model



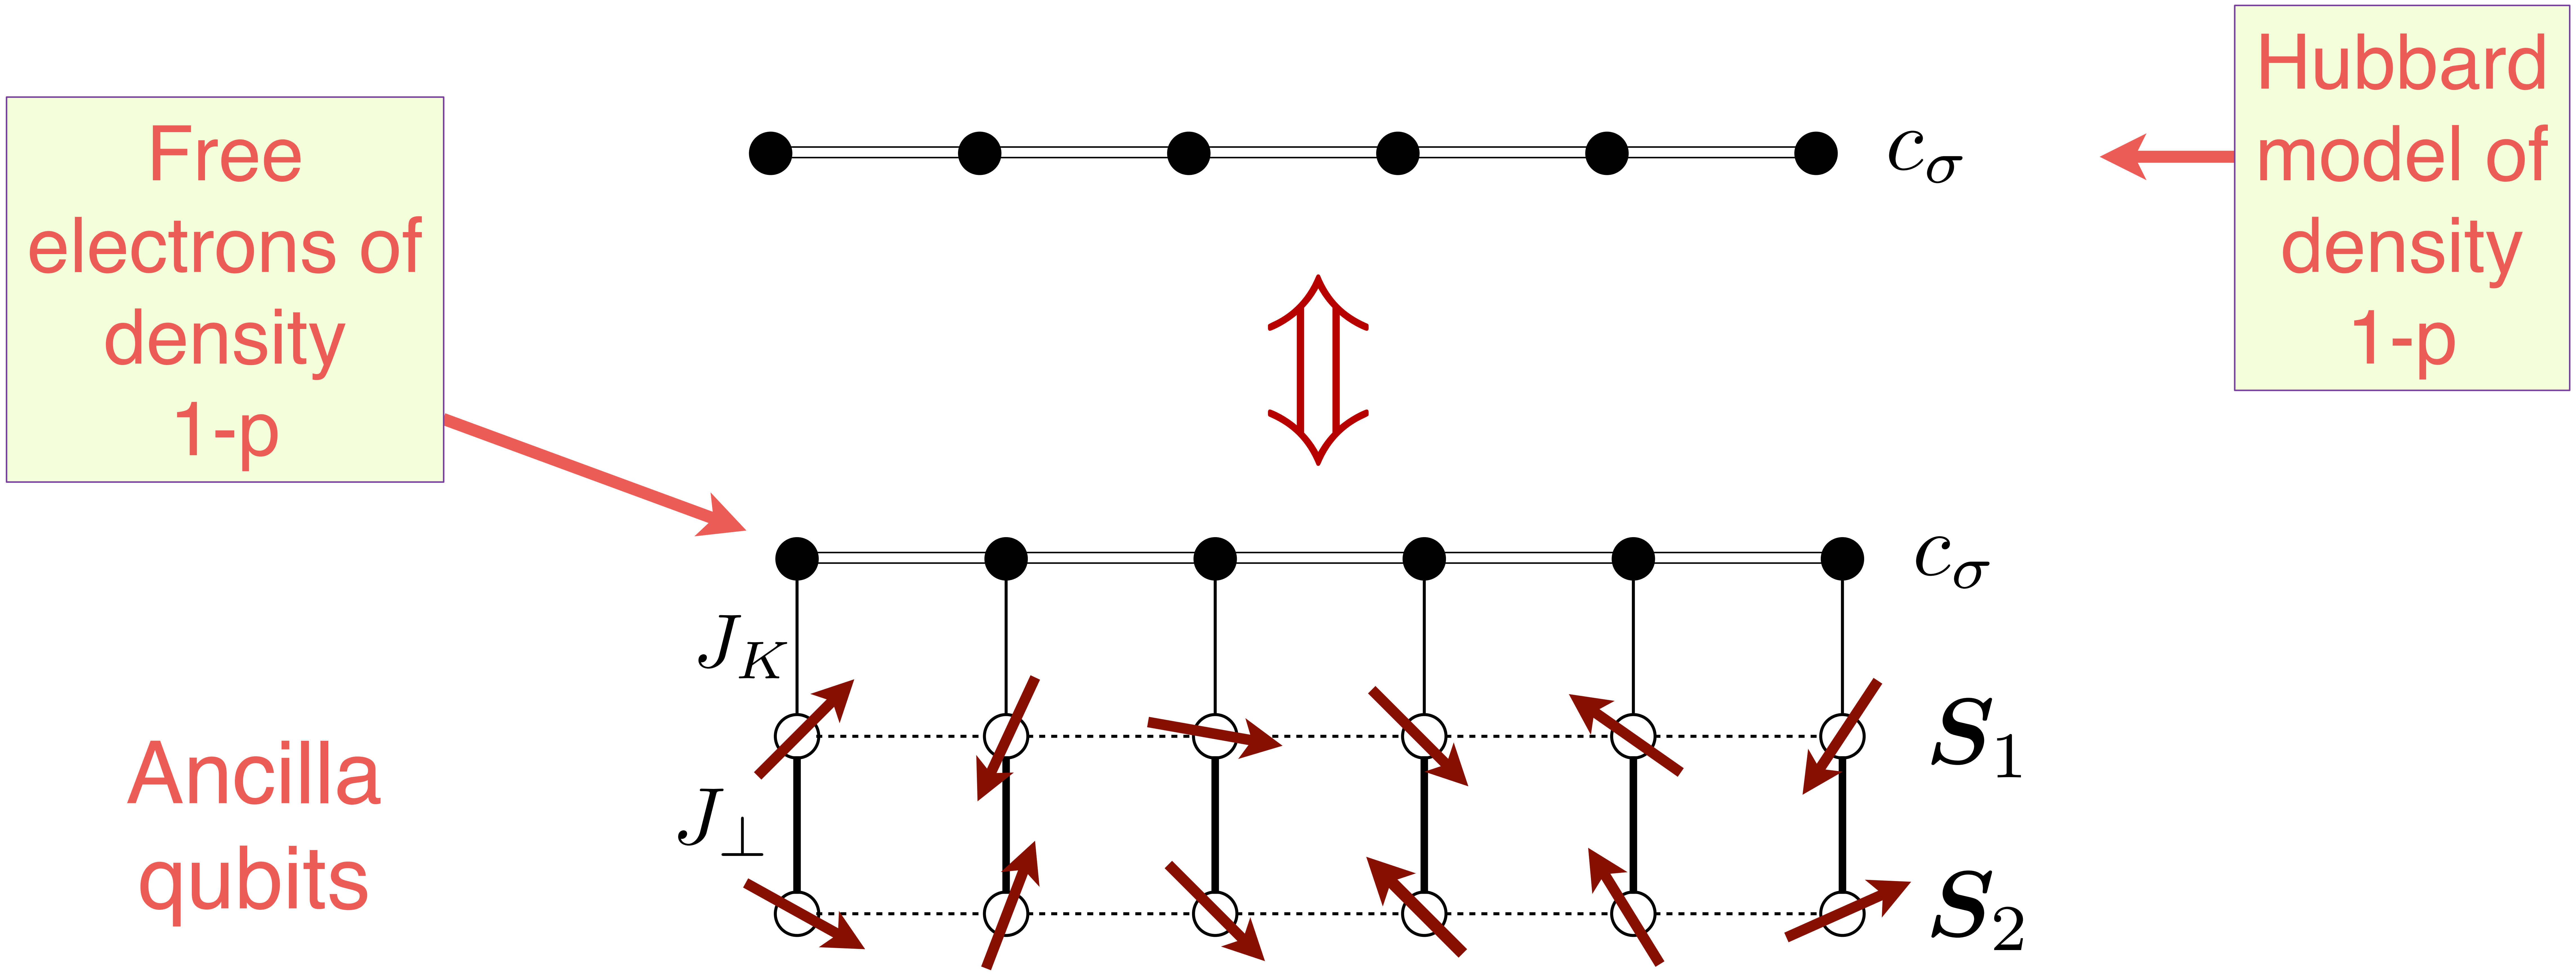
$$\mathcal{H}_{\rm paramagnon} = \sum_{\mathbf{p}} \varepsilon_{\mathbf{p}} c_{\mathbf{p}\sigma}^\dagger c_{\mathbf{p}\sigma} + J_K \sum_i c_{i\sigma}^\dagger \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{S}_{1i} + - \widetilde{J}_K \sum_i c_{i\sigma}^\dagger \frac{\boldsymbol{\tau}_{\sigma\sigma'}}{2} c_{i\sigma'} \cdot \boldsymbol{S}_{2i} + \ldots$$

Paramagnon fractionalization theory of the Hubbard model



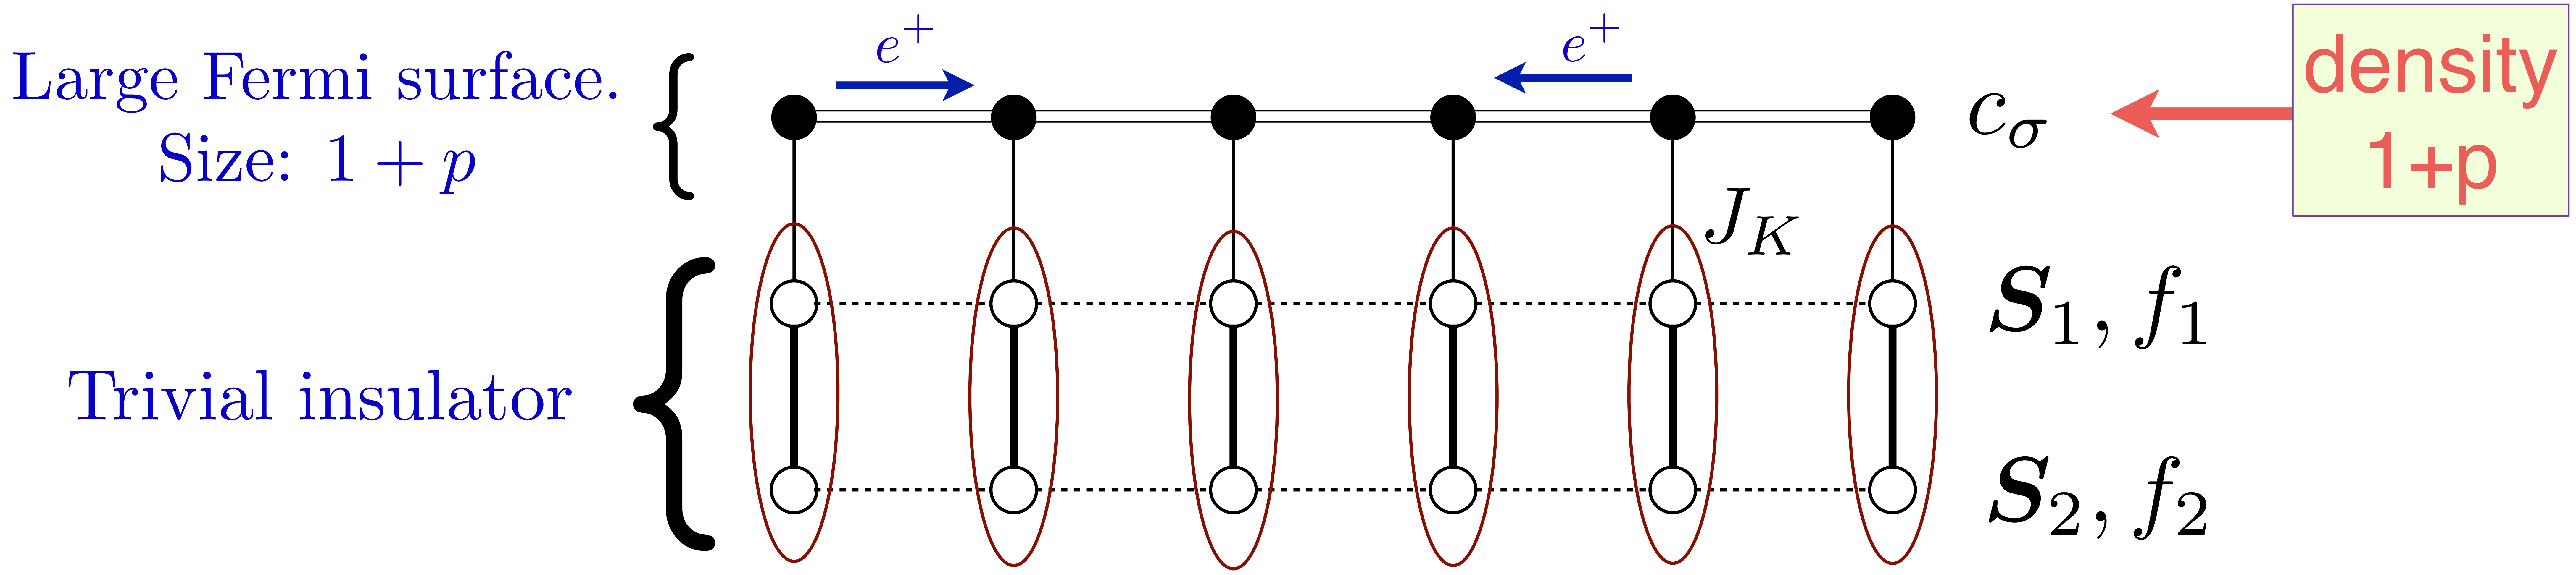
A FL* state is realized when the antiferromagnetic Kondo coupling dominates, and the c_σ and $\boldsymbol{S}_1$ form a "large" Fermi surface of hole density
$$(1+p)+1 = 2+p = p \text{ mod } 2!$$
The $\boldsymbol{S}_2$ must form a decoupled spin liquid which does not break translational symmetry, to obtain a metal with a non-Luttinger volume Fermi surface.

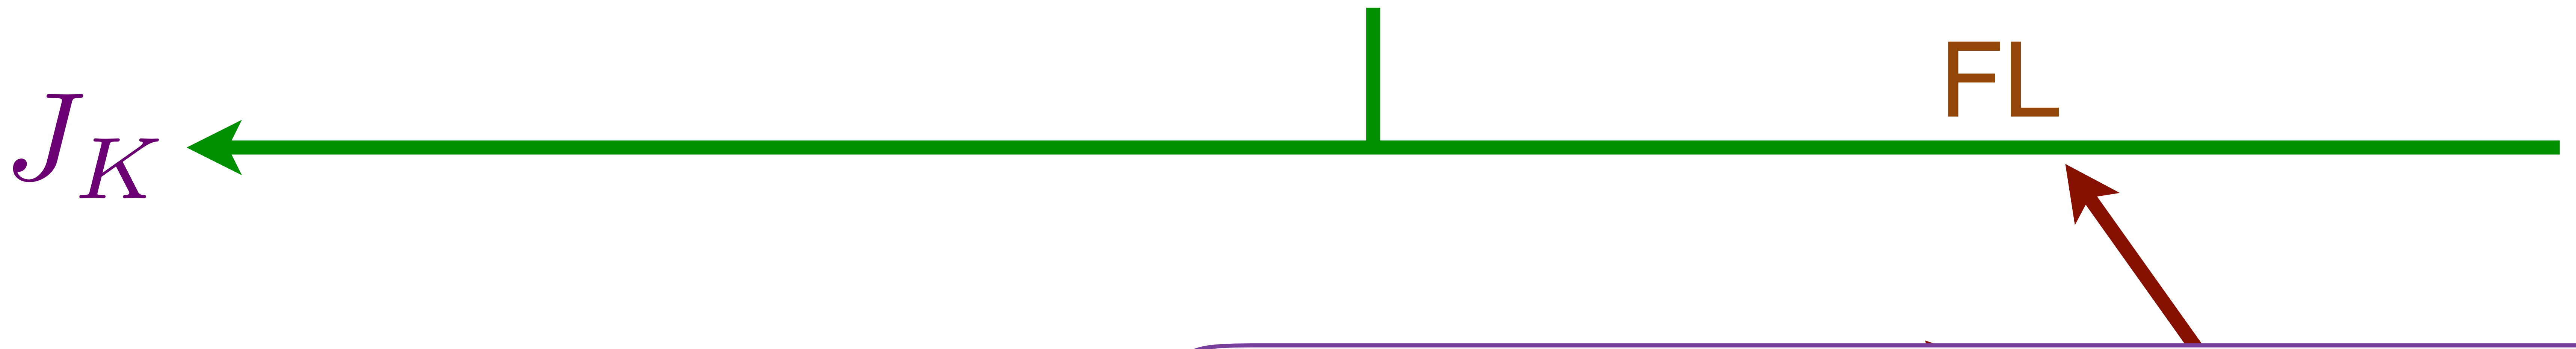
Paramagnon fractionalization theory of the Hubbard model



Related by a Schrieffer-Wolff canonical transformation with $U = \dfrac{3J_K^2}{8J_\perp} + \dfrac{3J_K^3}{16J_\perp} + \ldots$

Trial wavefunctions in the paramagnon fractionalization theory

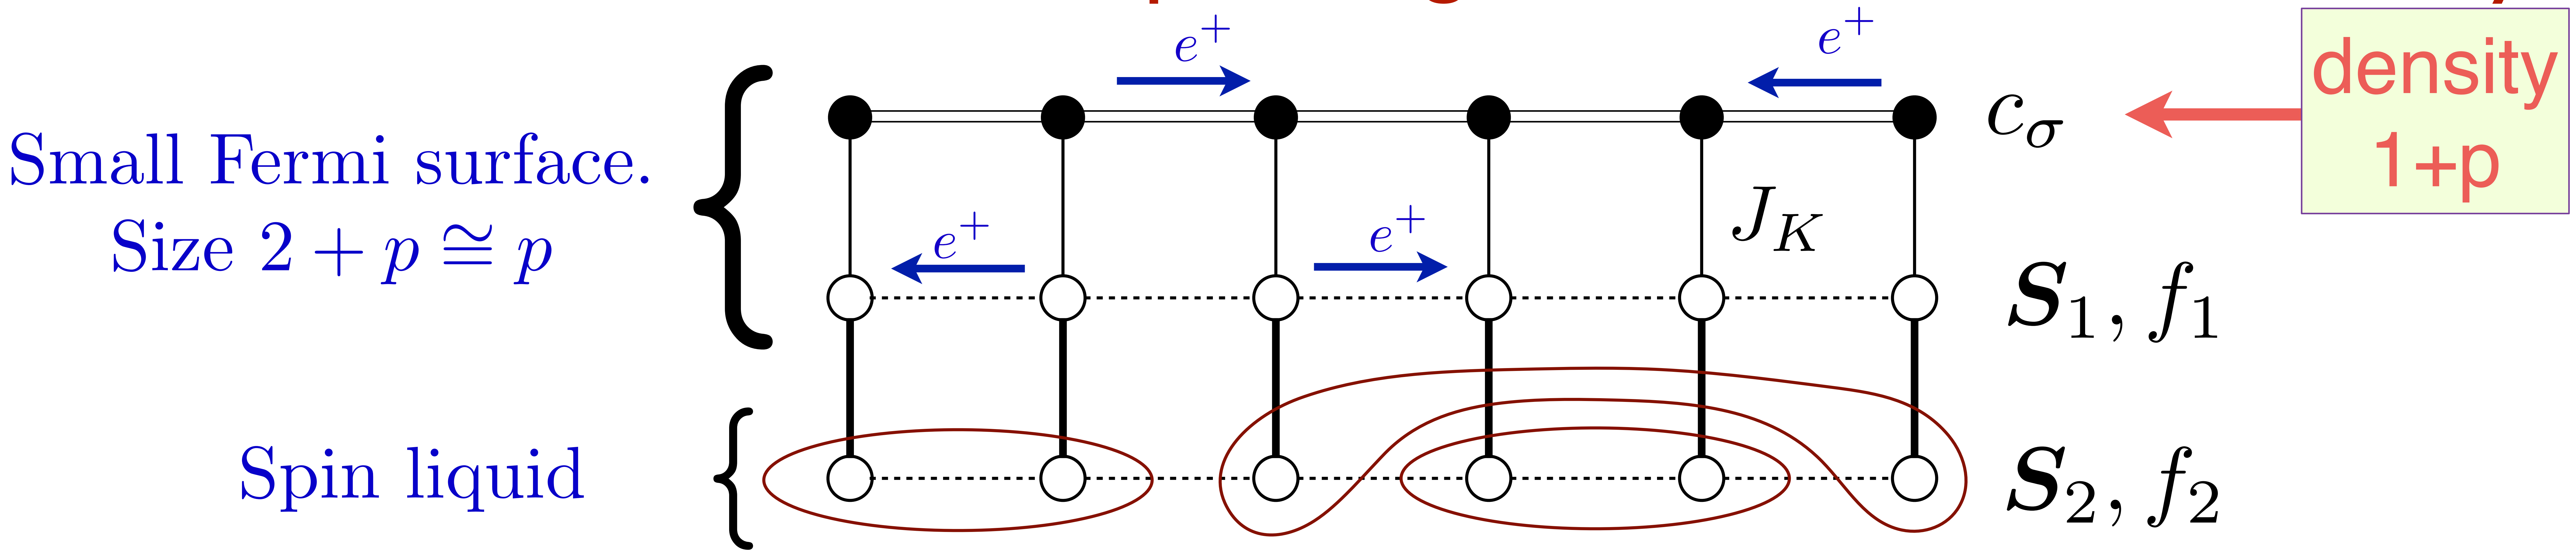


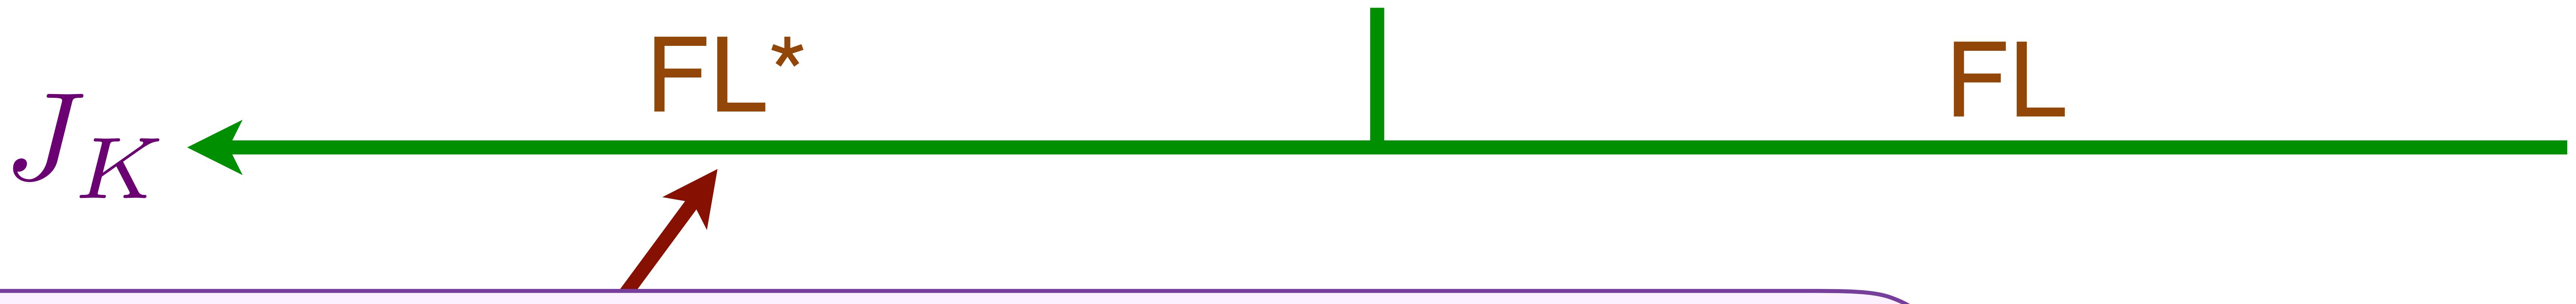


Large Fermi surface of size $1+p$

$$|\text{FL}\rangle = |\text{Rung singlets of } f_1, f_2\rangle \otimes |\text{Slater determinant of } c\rangle$$

Trial wavefunctions in the paramagnon fractionalization theory

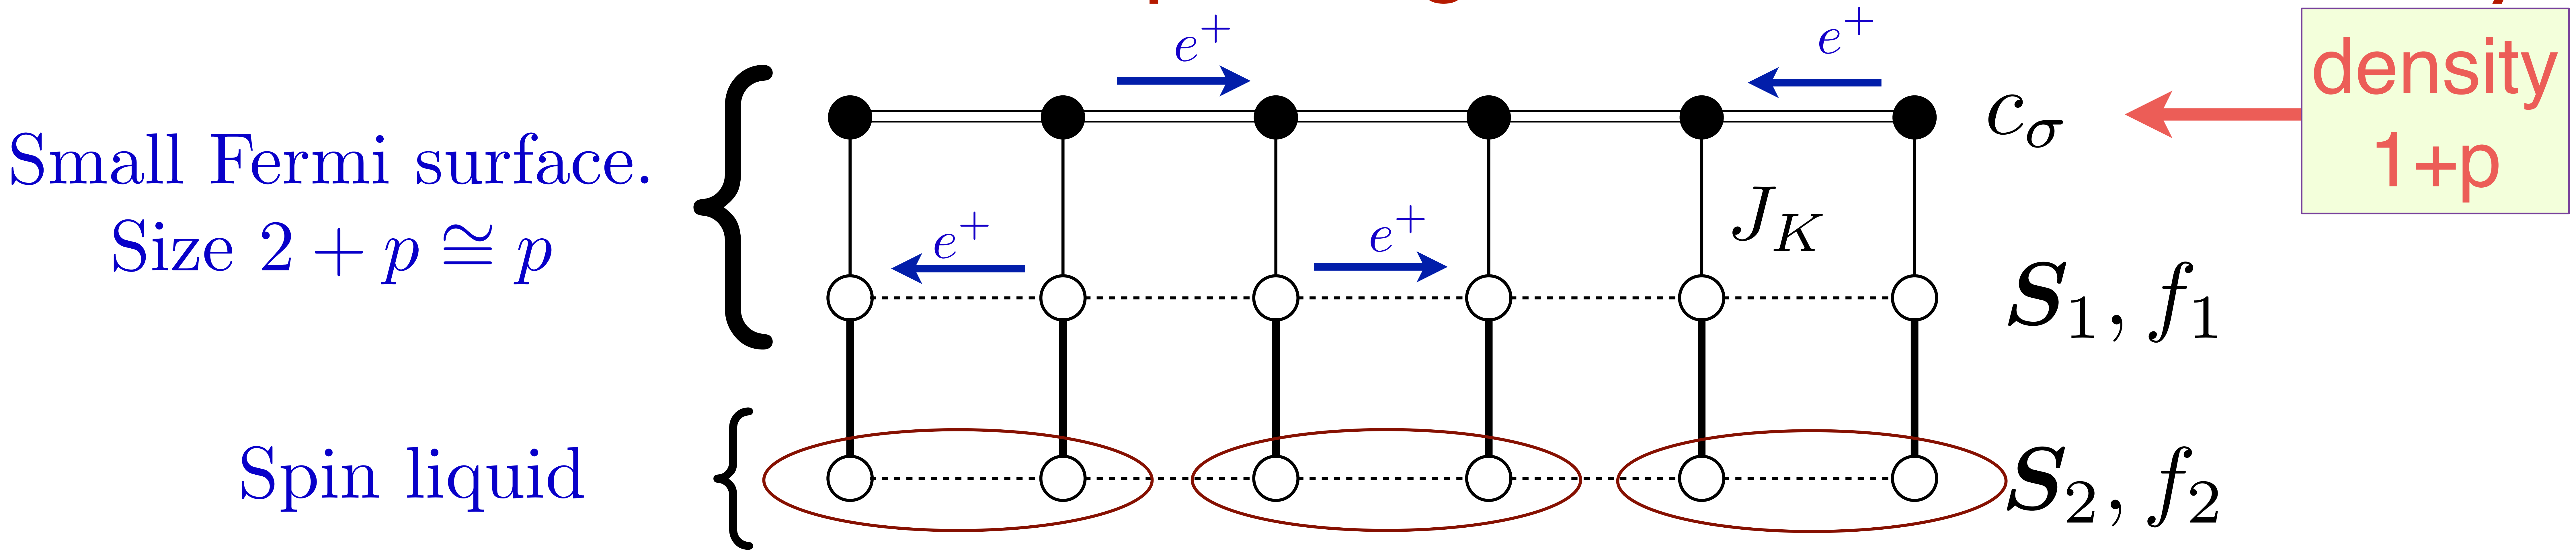


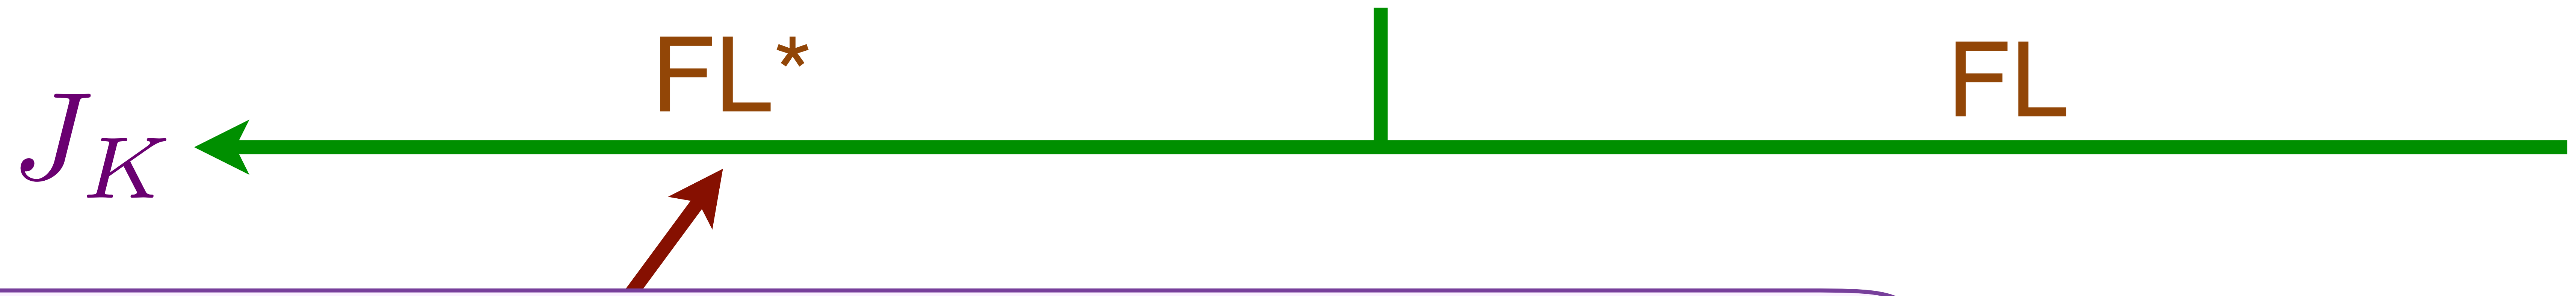


Small Fermi surface of size p

$$|\mathrm{FL}*\rangle = [\text{Projection onto rung singlets of } f_1, f_2] \bowtie |\text{Slater determinant of } (c, f_1)\rangle \otimes |\text{Slater determinant of } f_2\rangle$$

Trial wavefunctions in the paramagnon fractionalization theory





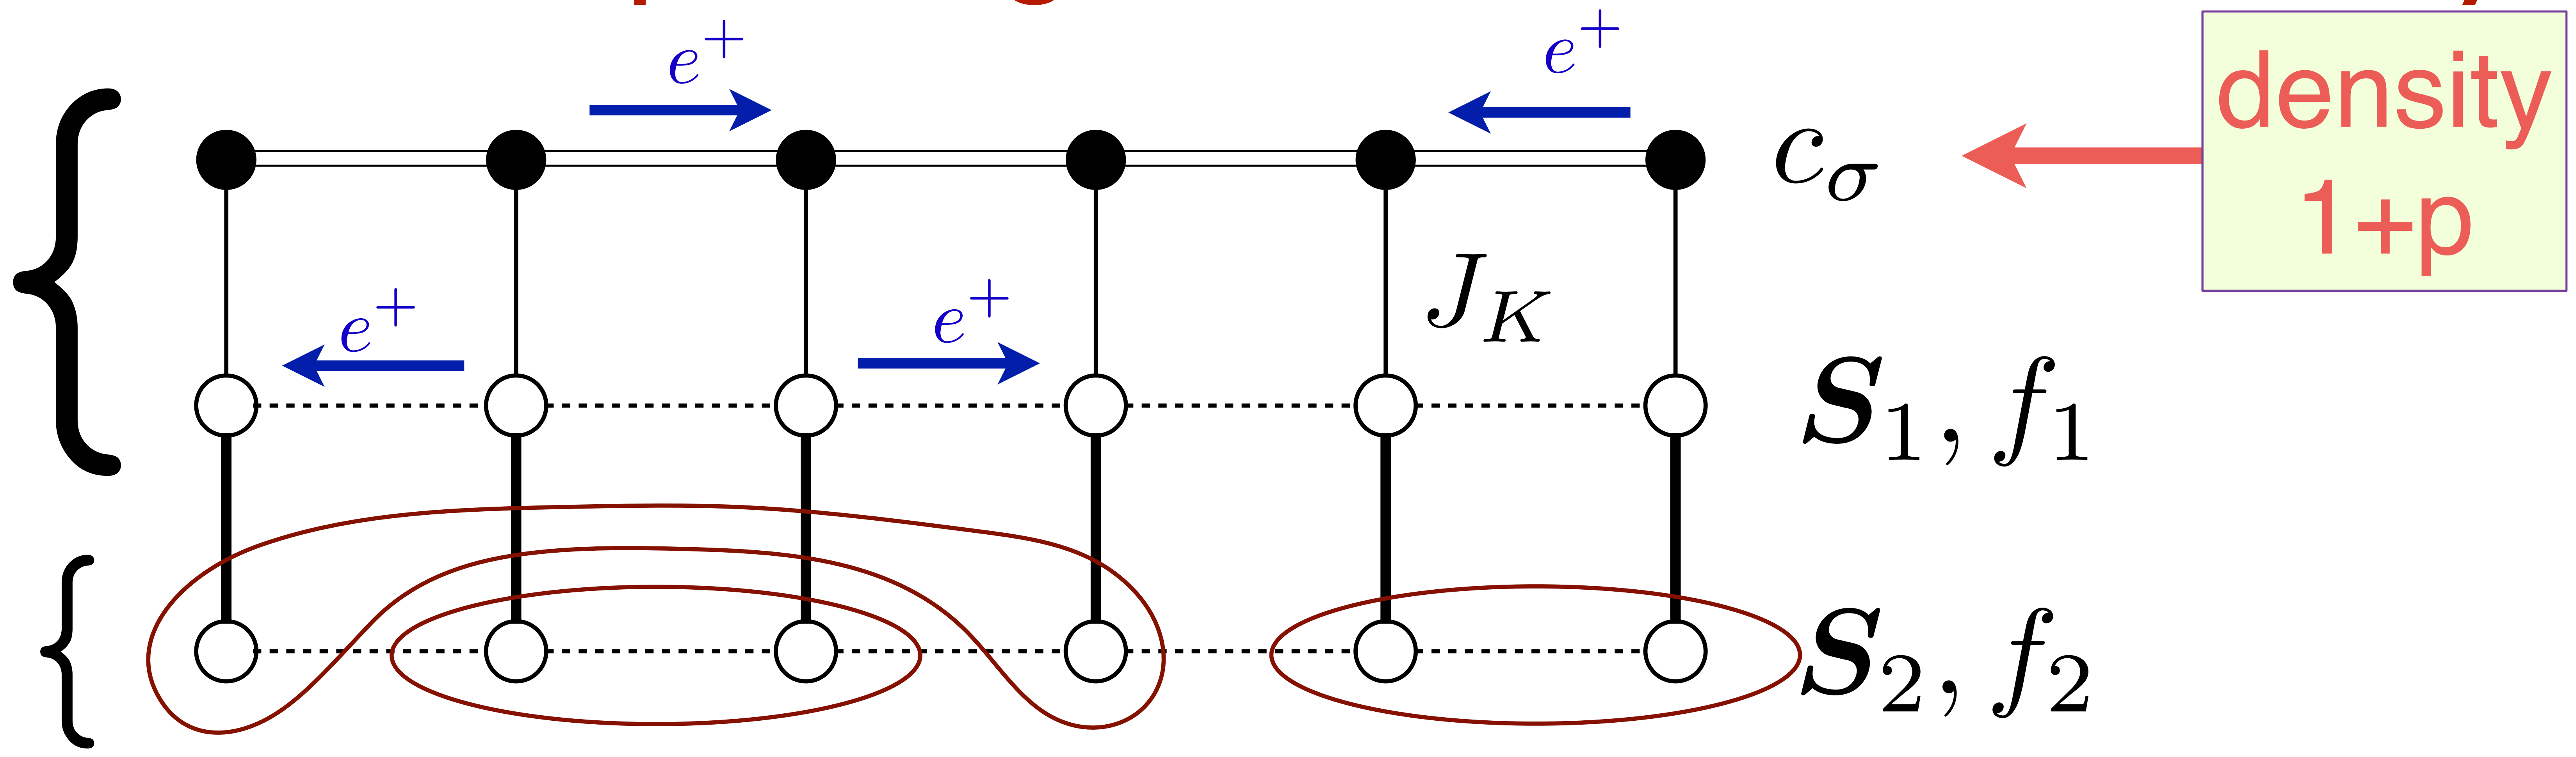
Small Fermi surface of size p

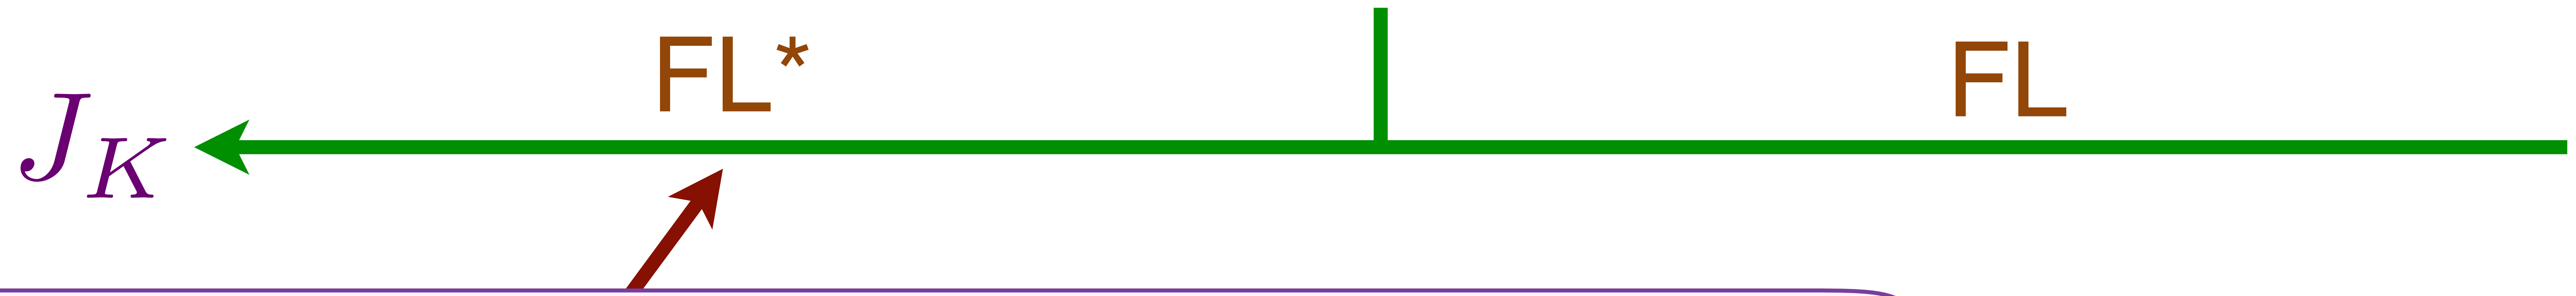
$$|\mathrm{FL}*\rangle = [\text{Projection onto rung singlets of } f_1, f_2] \bowtie |\text{Slater determinant of } (c, f_1)\rangle \otimes |\text{Slater determinant of } f_2\rangle$$

Trial wavefunctions in the paramagnon fractionalization theory

Small Fermi surface.
Size $2+p \cong p$

Spin liquid





Small Fermi surface of size p

$$|\text{FL}*\rangle = [\text{Projection onto rung singlets of } f_1, f_2] \bowtie |\text{Slater determinant of } (c, f_1)\rangle \otimes |\text{Slater determinant of } f_2\rangle$$

$(\mathrm{SU}(2)_1 \times \mathrm{SU}(2)_2 \times \mathrm{SU}(2)_S)/\mathbb{Z}_2$ gauge theory of **one-band** model

Fermion partons of ancilla spins: $\boldsymbol{S}_1 = f_{1\alpha}^\dagger \boldsymbol{\sigma}_{\alpha\beta} f_{1\beta}$, $\boldsymbol{S}_2 = f_{2\alpha}^\dagger \boldsymbol{\sigma}_{\alpha\beta} f_{2\beta}$.
Write fermion partons as 2×2 matrices

$$\boldsymbol{f}_1 = \begin{pmatrix} f_{1\uparrow} & -f_{1\downarrow}^\dagger \\ f_{1\downarrow} & f_{1\uparrow}^\dagger \end{pmatrix} \quad , \quad \boldsymbol{f}_2 = \begin{pmatrix} f_{2\uparrow} & -f_{2\downarrow}^\dagger \\ f_{2\downarrow} & f_{2\uparrow}^\dagger \end{pmatrix}$$

P.A. Lee, N. Nagaosa, and X.-G. Wen, RMP **78**, 17 (2006)

Constraints $f_{1\alpha}^\dagger f_{1\alpha} = 1$ and $f_{2\alpha}^\dagger f_{2\alpha} = 1$ lead to:

$$\mathrm{SU}(2)_1 : \quad \boldsymbol{f}_1 \to \boldsymbol{f}_1 U_1 \quad , \quad \boldsymbol{f}_2 \to \boldsymbol{f}_2$$
$$\mathrm{SU}(2)_2 : \quad \boldsymbol{f}_1 \to \boldsymbol{f}_1 \quad , \quad \boldsymbol{f}_2 \to \boldsymbol{f}_2 U_2$$

S. Sachdev, M.A. Metlitski, Yang Qi, and Cenke Xu, PRB **80**, 155129 (2009)
S. Sachdev, H. D. Scammell, M. S. Scheurer, and G. Tarnopolsky, PRB **99**, 054516 (2019)

Rung singlet formation $\boldsymbol{S}_1 + \boldsymbol{S}_2 \approx 0$ leads to:

$$\mathrm{SU}(2)_S : \quad \boldsymbol{f}_1 \to U_S \boldsymbol{f}_1 \quad , \quad \boldsymbol{f}_2 \to U_S \boldsymbol{f}_2$$

Summary

- Probing $\mathbb{Z}_2$ spin liquid with Rydberg atoms:
  Two-state Rydberg atoms on the kagome and ruby lattices can be written *exactly* as a $\mathbb{Z}_2$ gauge theory. Evidence for intermediate scale deconfinement of a $\mathbb{Z}_2$ gauge theory on the ruby lattice.

Summary

- Probing $\mathbb{Z}_2$ spin liquid with Rydberg atoms:
  Two-state Rydberg atoms on the kagome and ruby lattices can be written *exactly* as a $\mathbb{Z}_2$ gauge theory. Evidence for intermediate scale deconfinement of a $\mathbb{Z}_2$ gauge theory on the ruby lattice.

- Paramagnon fractionalization theory of FL* for the pseudogap metal of the cuprate high temperature superconductors:
  Don't fractionalize the mobile electron, but fractionalize the 'paramagnon rotor' into 'ancilla qubits'.
  Predicts electronic spectra in good agreement with observations in *both* nodal and anti-nodal regions.
  $(\mathrm{SU}(2)_1 \times \mathrm{SU}(2)_2 \times \mathrm{SU}(2)_S)/\mathbb{Z}_2$ theory for transition from FL* to FL.
