

Exploration of time ordering of events in MDT – Simulation

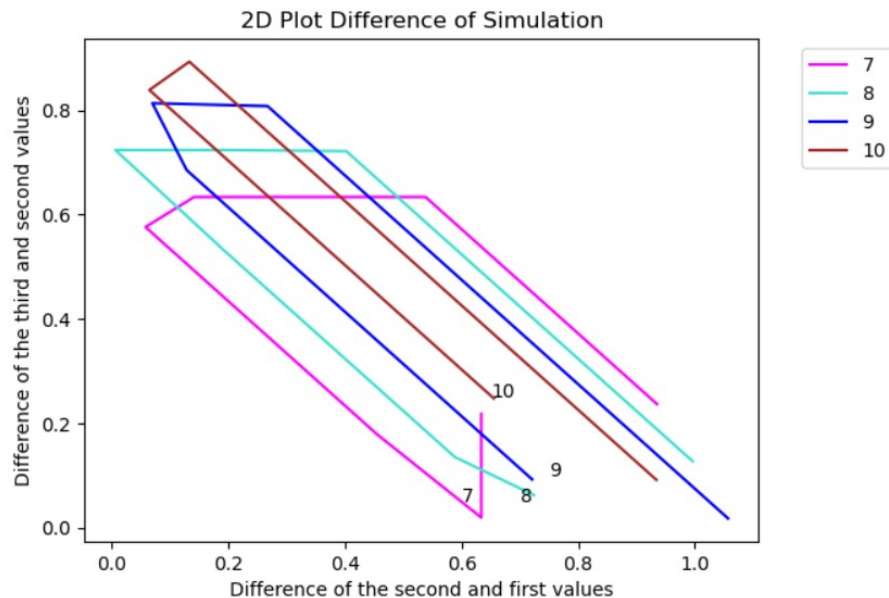

- Simulation with variation of Position:
Values between 1.6 cm to 2.5 cm, angle is fixed
- Calculation of the minimal distances to the centres of the tubes
- Simulation with variation of the angles
=> Simulation of the resolution
1 degree variation with steps of 0.01 degree
- Position is fixed
- Calculation of the minimal distances to the centres of the tubes

Differences of the distance Values – Simulation of Position Variation

- Plots with the difference of the first and second distance values on the x-axis
- Difference of the second and third distance values on the y-axis
- Values are between: 0.0 cm to 1.0 cm
- Curve changes with higher angles

Exploration of time ordering of events in MDT

- Below: 2D Plot of the differences with a simulation of fixed position and variation of the angles

=> we see straight lines

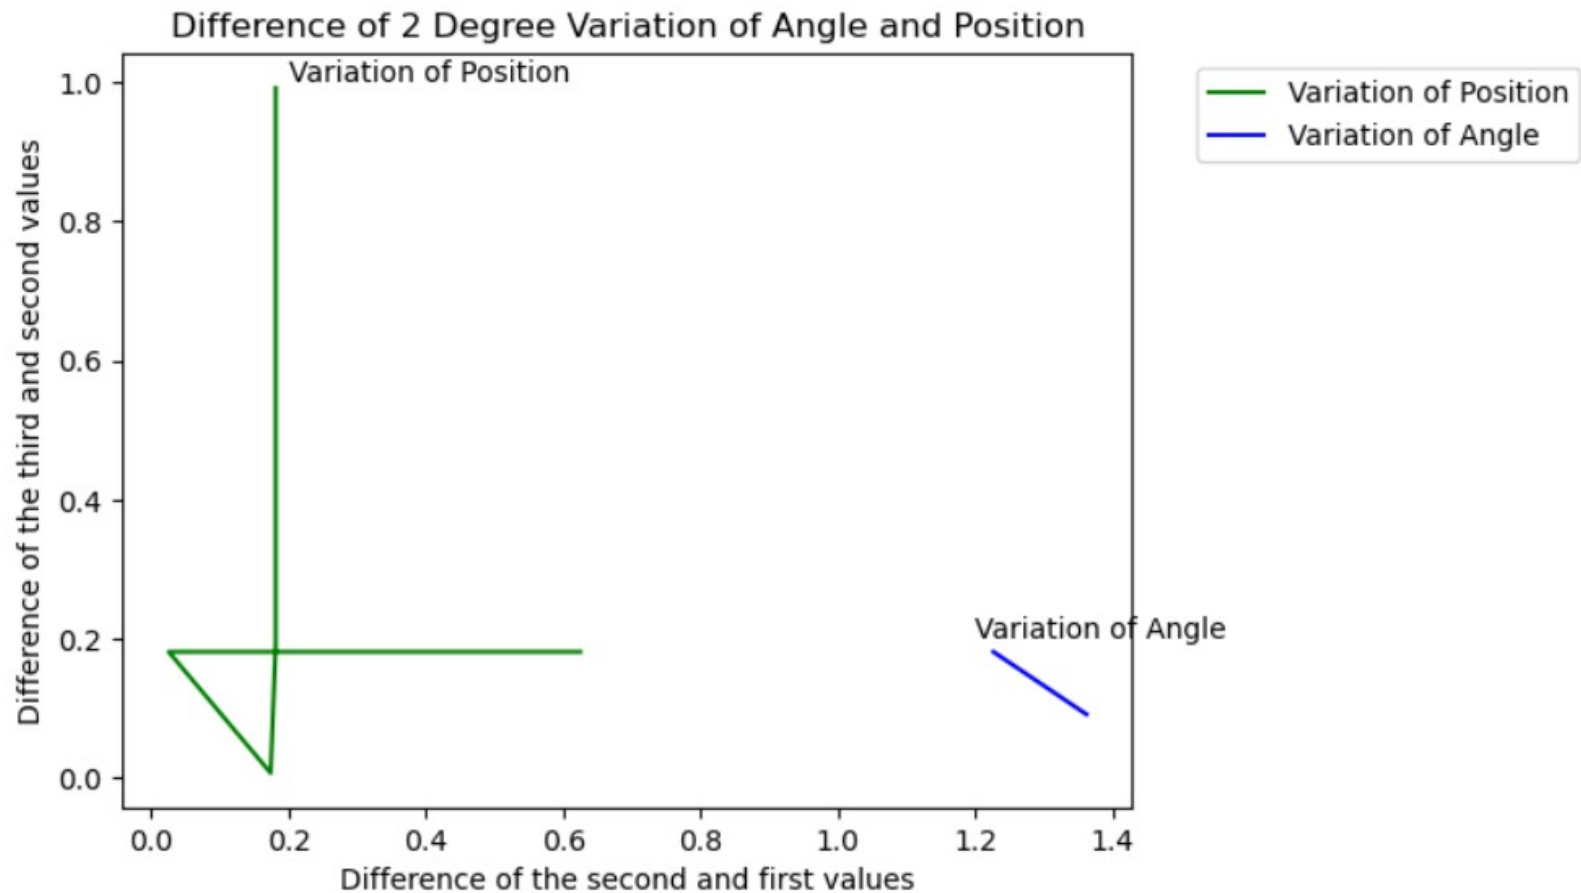

=> different shape than variation of position with fixed angles

- Below: values between: 0.0 cm to 0.9 cm on the y axis

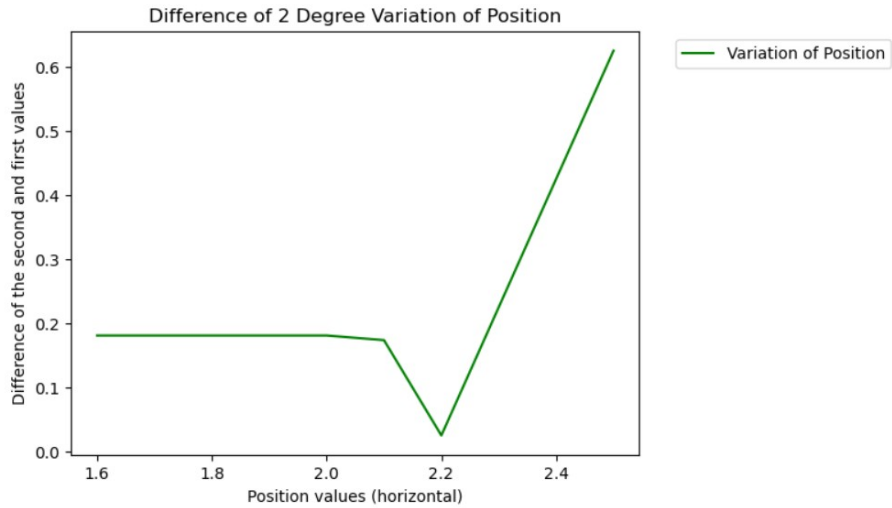

0.0 cm to 1.4 cm on the x axis

2 Degree Variation of Position and Angle - closer Analysis

Variation of Position- Differences plotted against Position Values

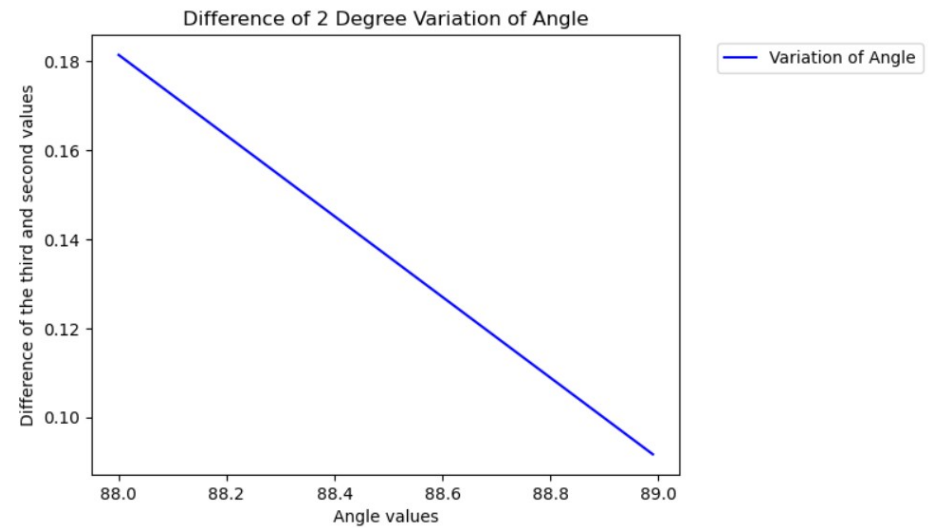

- Difference of second and first distance value: first constant value, then decreases, 2.2 cm to 2.5 cm increases

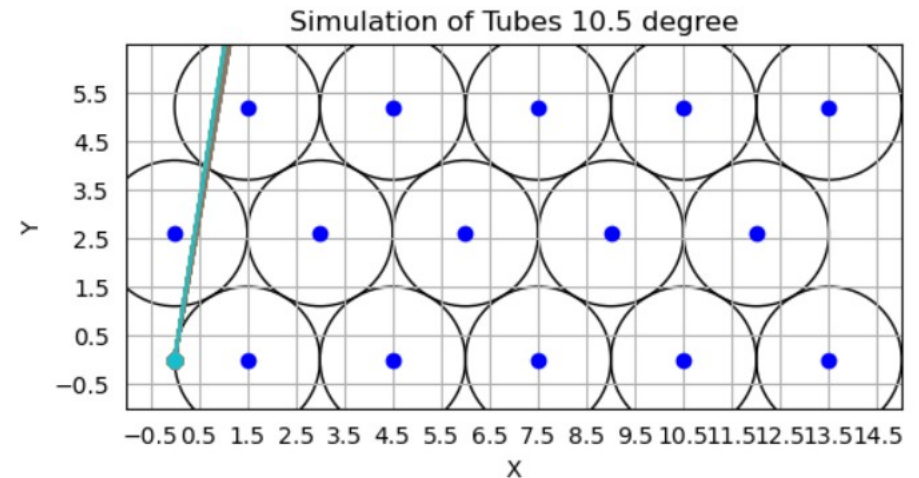

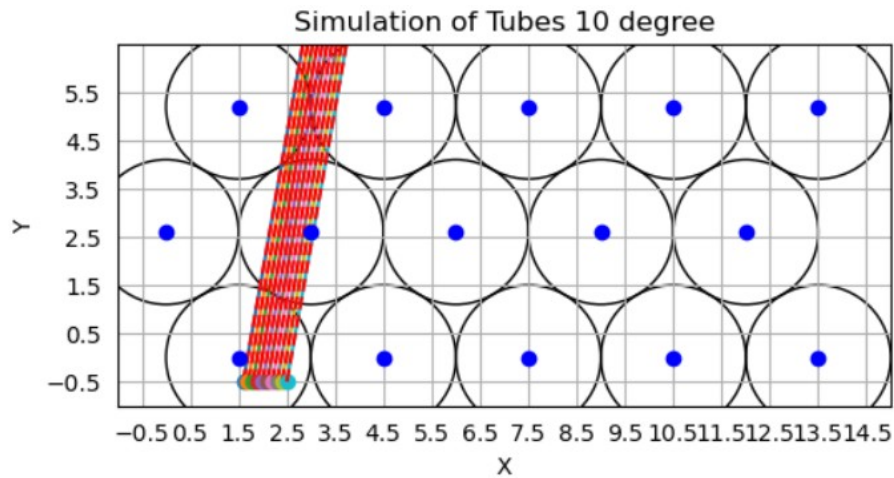

- Difference of second and third: first decreases, then increases, constant between 2.2 cm and 2.5 cm

Variation of Angles- Differences plotted against Angle Values

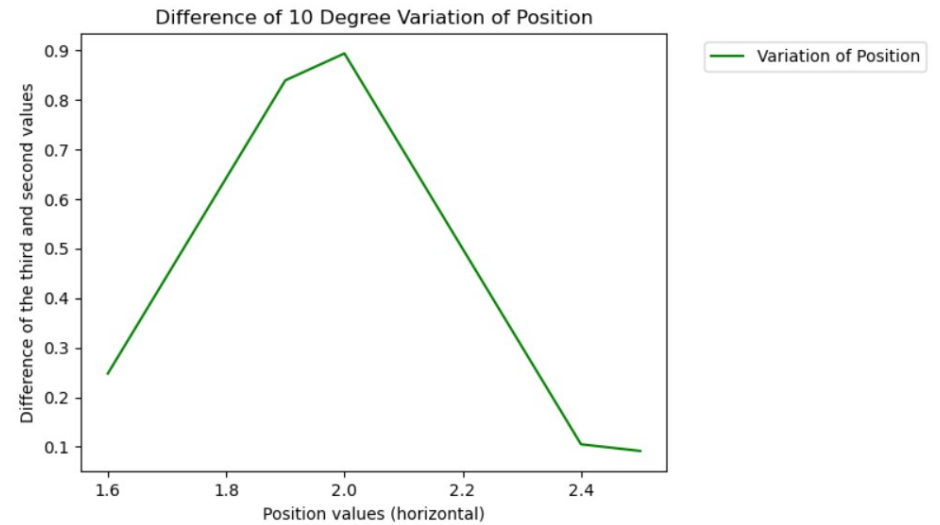

Exploration of time ordering of events in MDT

10 Degree Variation of Position and Angle - closer Analysis

Variation of Position- Differences plotted against Position Values

Variation of Angles- Differences plotted against Angle Values

Exploration of time ordering of events in MDT- Applying Real Data
