Traveling-Wave Electron Acceleration

Energy-efficient Laser-plasma acceleration beyond the dephasing and depletion limits

Challenges in Laser-wakefield acceleration for reaching electron energies beyond 10 GeV

- **Self-phase modulation and laser pump depletion**

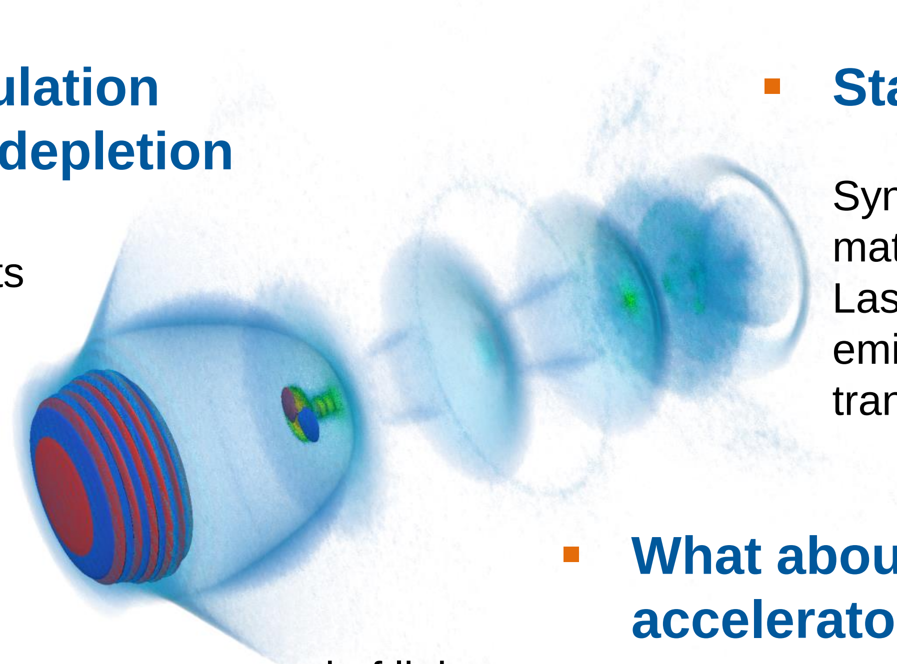
  Drive laser transfers its energy to the plasma.

- **Dephasing limit**

  Laser propagates below vacuum speed of light, so accelerated electrons outrun wakefield

- **Laser pulse guiding**

  Guiding of high-power lasers over extended distances at low densities $<10^{17}\ \mathrm{cm}^{-3}$



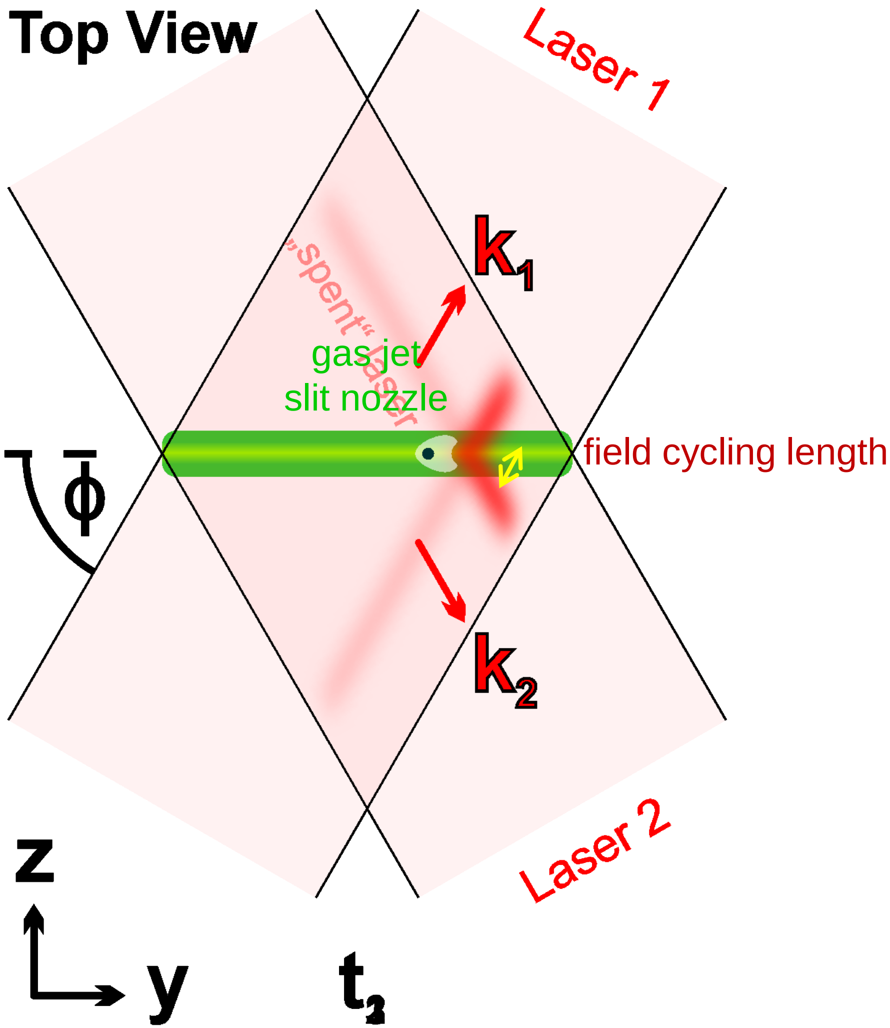
- **Staging is hard!**

  Synchronization, Beam size matching, charge loss, Laser in/outcoupling, emittance growth in beam transport, etc.

- **What about Plasma-wakefield accelerators?**

  Another accelerator required, energy gain limited by transformer ratio, beam-instabilities.

Traveling-Wave Electron Acceleration (TWEAC)



- Pulse-front tilted laser enforces vacuum speed of light propagation of laser overlap in plasma.

$$\alpha = \Phi/2 \;\rightarrow\; v_{wake} \equiv c$$

- Oblique laser beam geometry continuously feeds a „fresh“ portion of the laser beams into an unperturbed plasma.

L(accelerator**)** **>** **L(**depletion length**)**

is fine, as long

L(field cycling length**)** **<** **L(**depletion length**)**

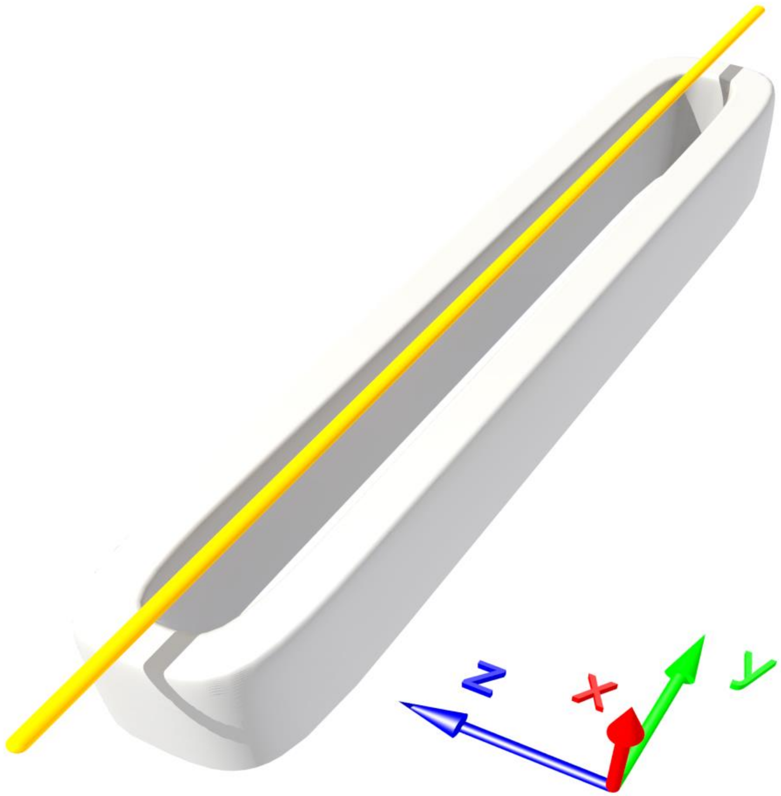
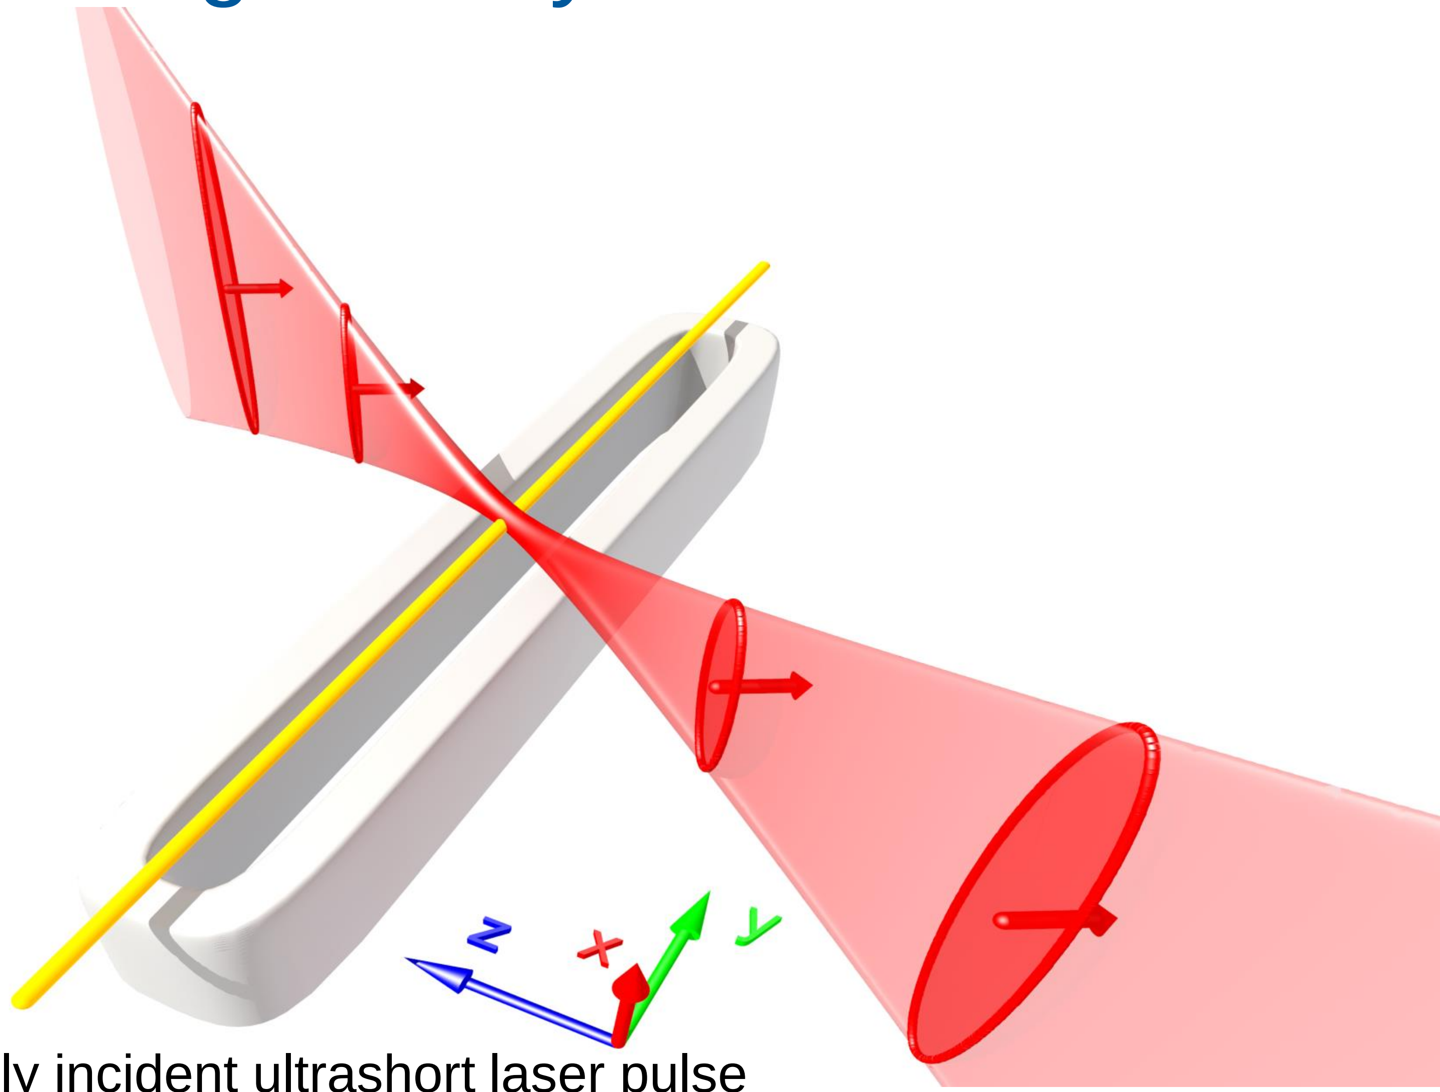
TWEAC geometry in a nutshell



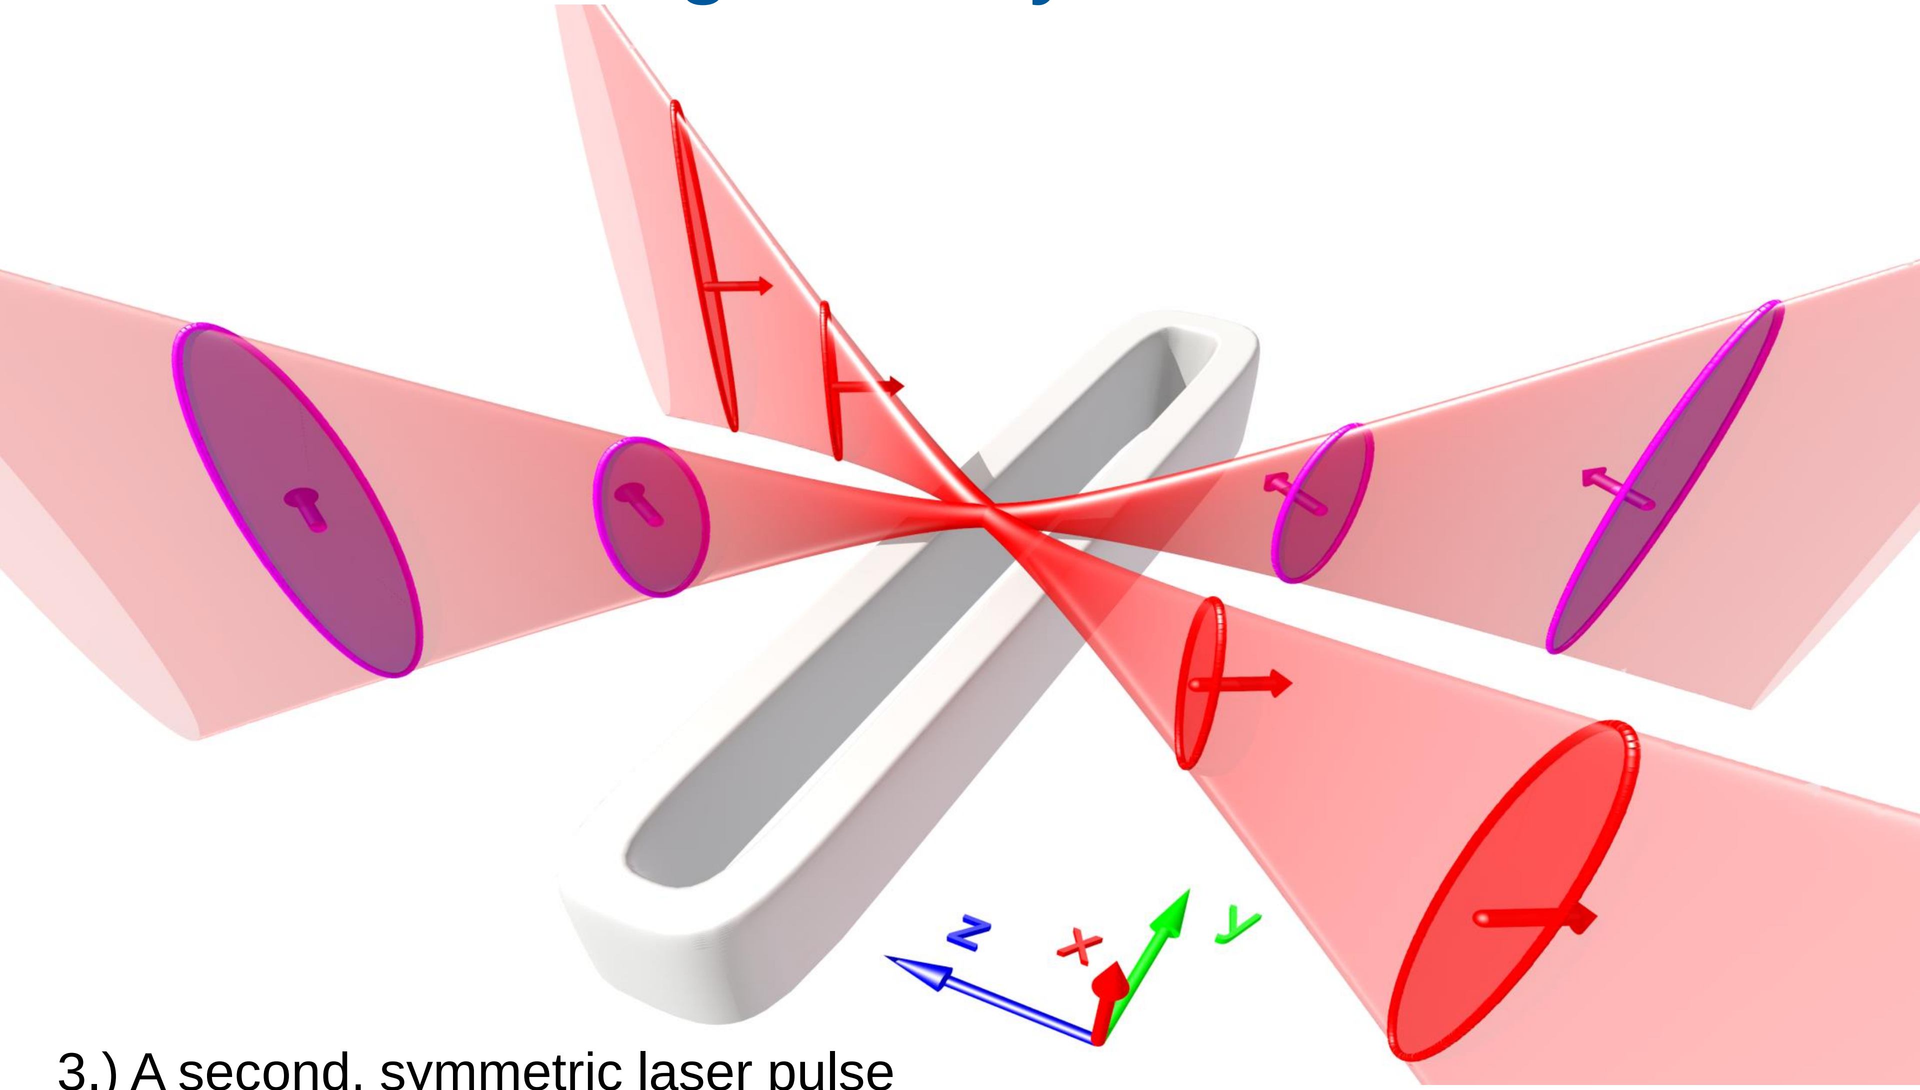
1.) An extended gas jet slit nozzle defines a line focus axis for cylindrical optics.

TWEAC geometry in a nutshell



2.) A first, obliquely incident ultrashort laser pulse
with a carefully tuned pulse-front tilt creates a comoving focus.

TWEAC geometry in a nutshell

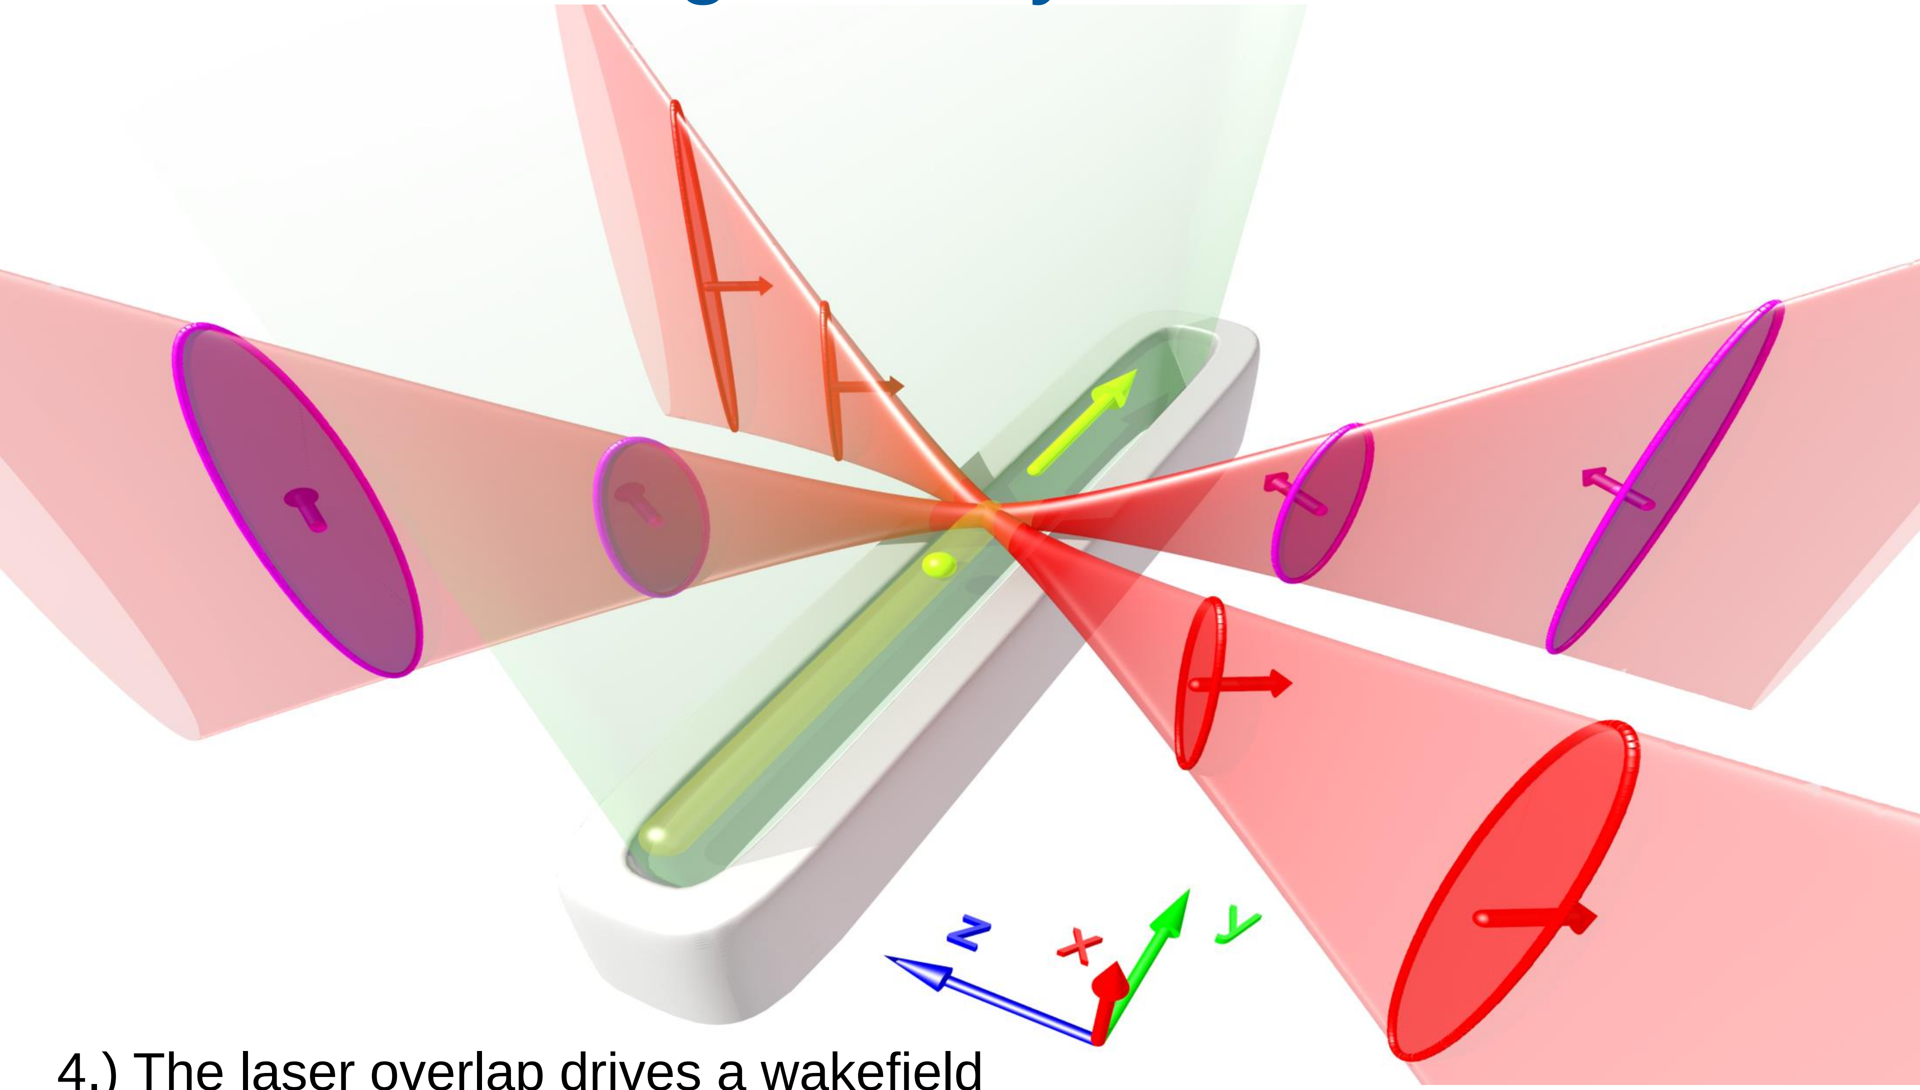


3.) A second, symmetric laser pulse
overlaps with the first laser.

DRESDEN concept

HZDR

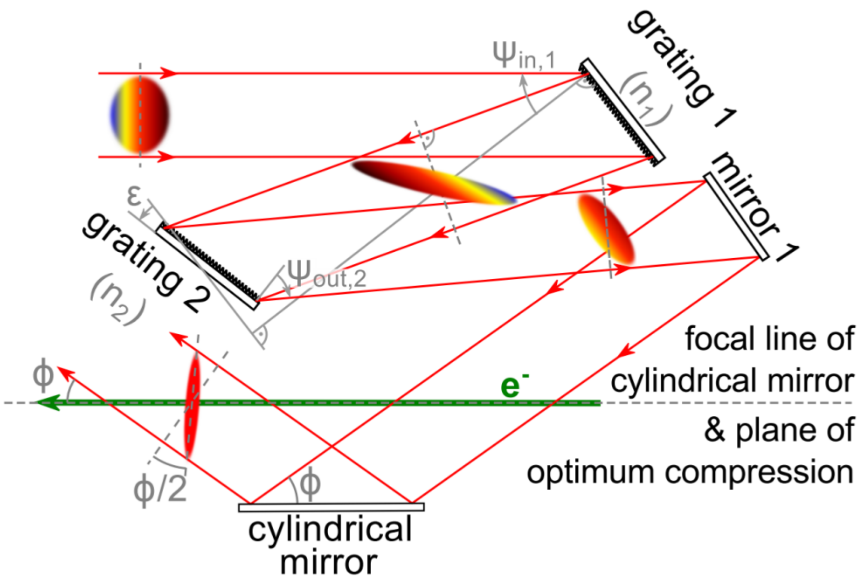
TWEAC geometry in a nutshell



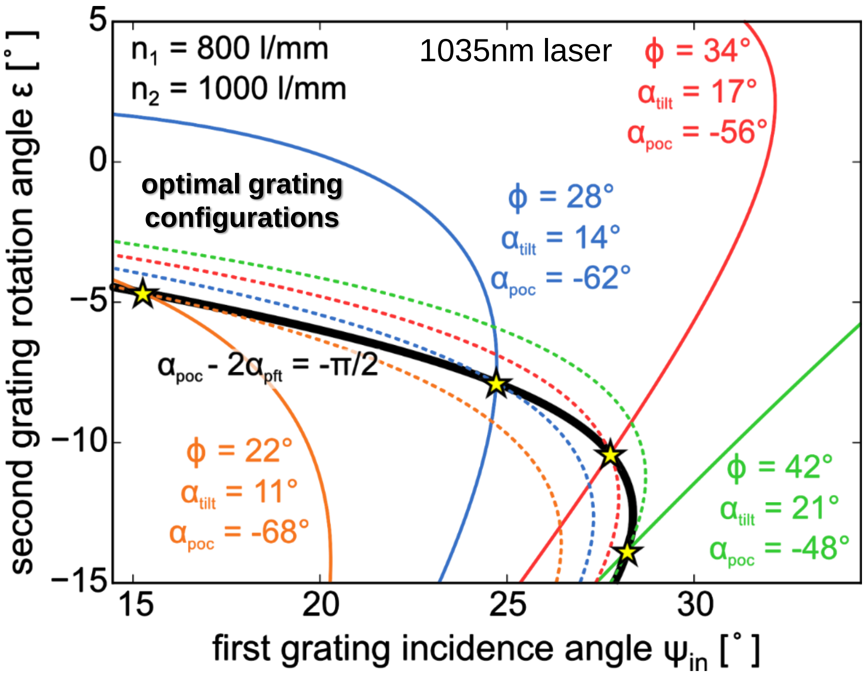
4.) The laser overlap drives a wakefield moving with the vacuum speed of light.

TWEAC type lasers are experimentally feasible using standard optics

Optical setups for TWEAC are similar to Traveling-Wave Thomson-Scattering



Pulse synthesis using two-grating setups provides tunability by varying pulse-front tilt.



Traveling-Wave Thomson-Scattering aims for

High photon yields per shot, low bandwidths, tunablitity and all-optical FELs

Simulate TWEAC using PIConGPU

An open source, fully relativistic, 3D3V particle-in-cell code

- runs on any hardware
- scales on large clusters
- efficient parallel I/O
- in-situ data analysis avoids bandwidth bottleneck

Download Github repository

picongpu.hzdr.de

It is open source!

- performance portable
- single source

Simulate TWEAC using PIConGPU

An open source, fully relativistic, 3D3V particle-in-cell code

Challenges for simulating TWEAC

- runs on any hardware
- scales on large clusters
- efficient parallel I/O
- in-situ data analysis avoids bandwidth bottleneck

Download Github repository

picongpu.hzdr.de

It is open source!

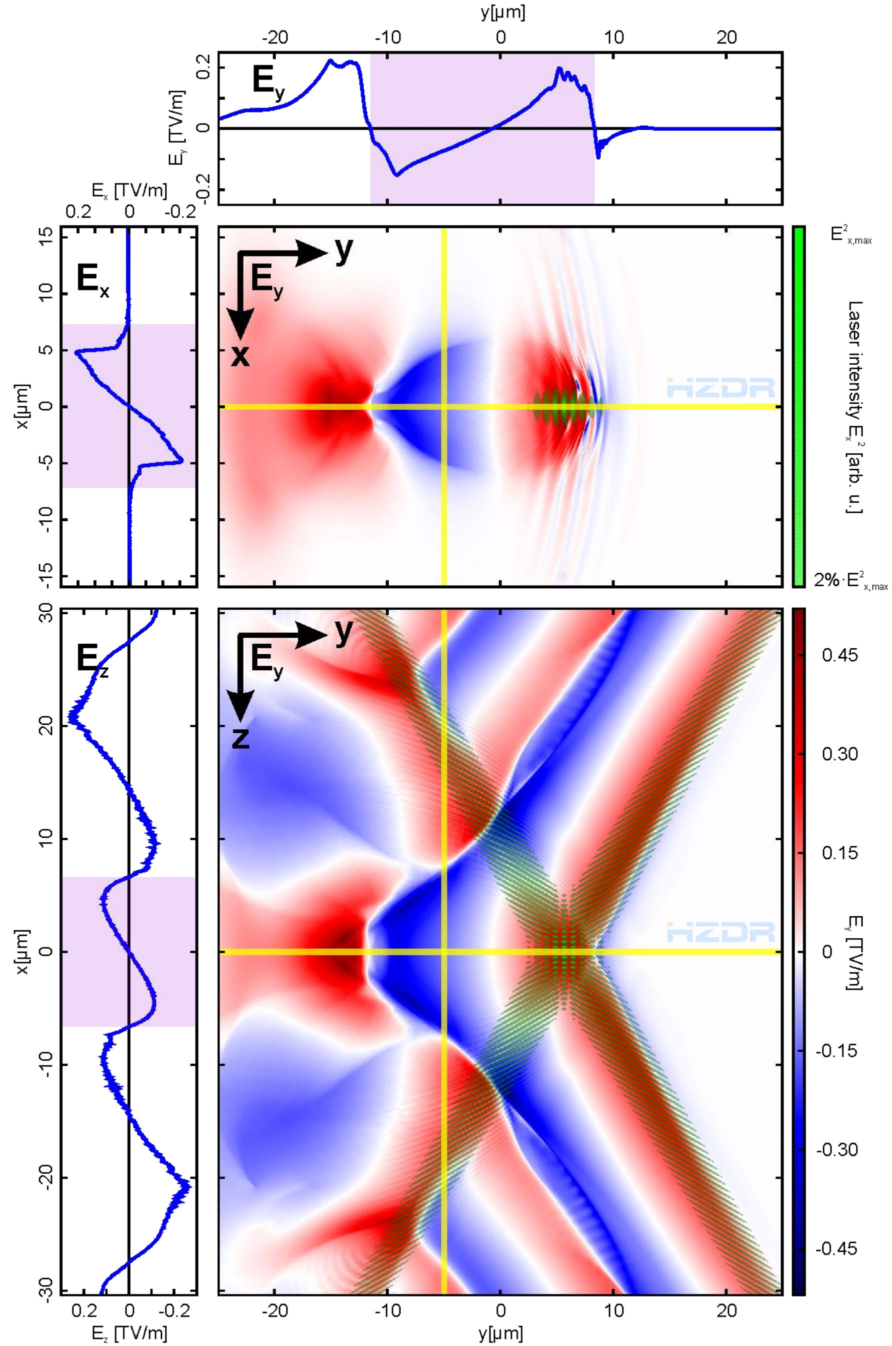
- Non-rotationally symmetric 3D geometry
- Long acceleration lengths beyond LWFA depletion and dephasing lengths
- Requires robust laser insertion, extraction and absorbtion techniques at simulation boundaries

→ **High requirements on performance, resolution, memory and boundary conditions**

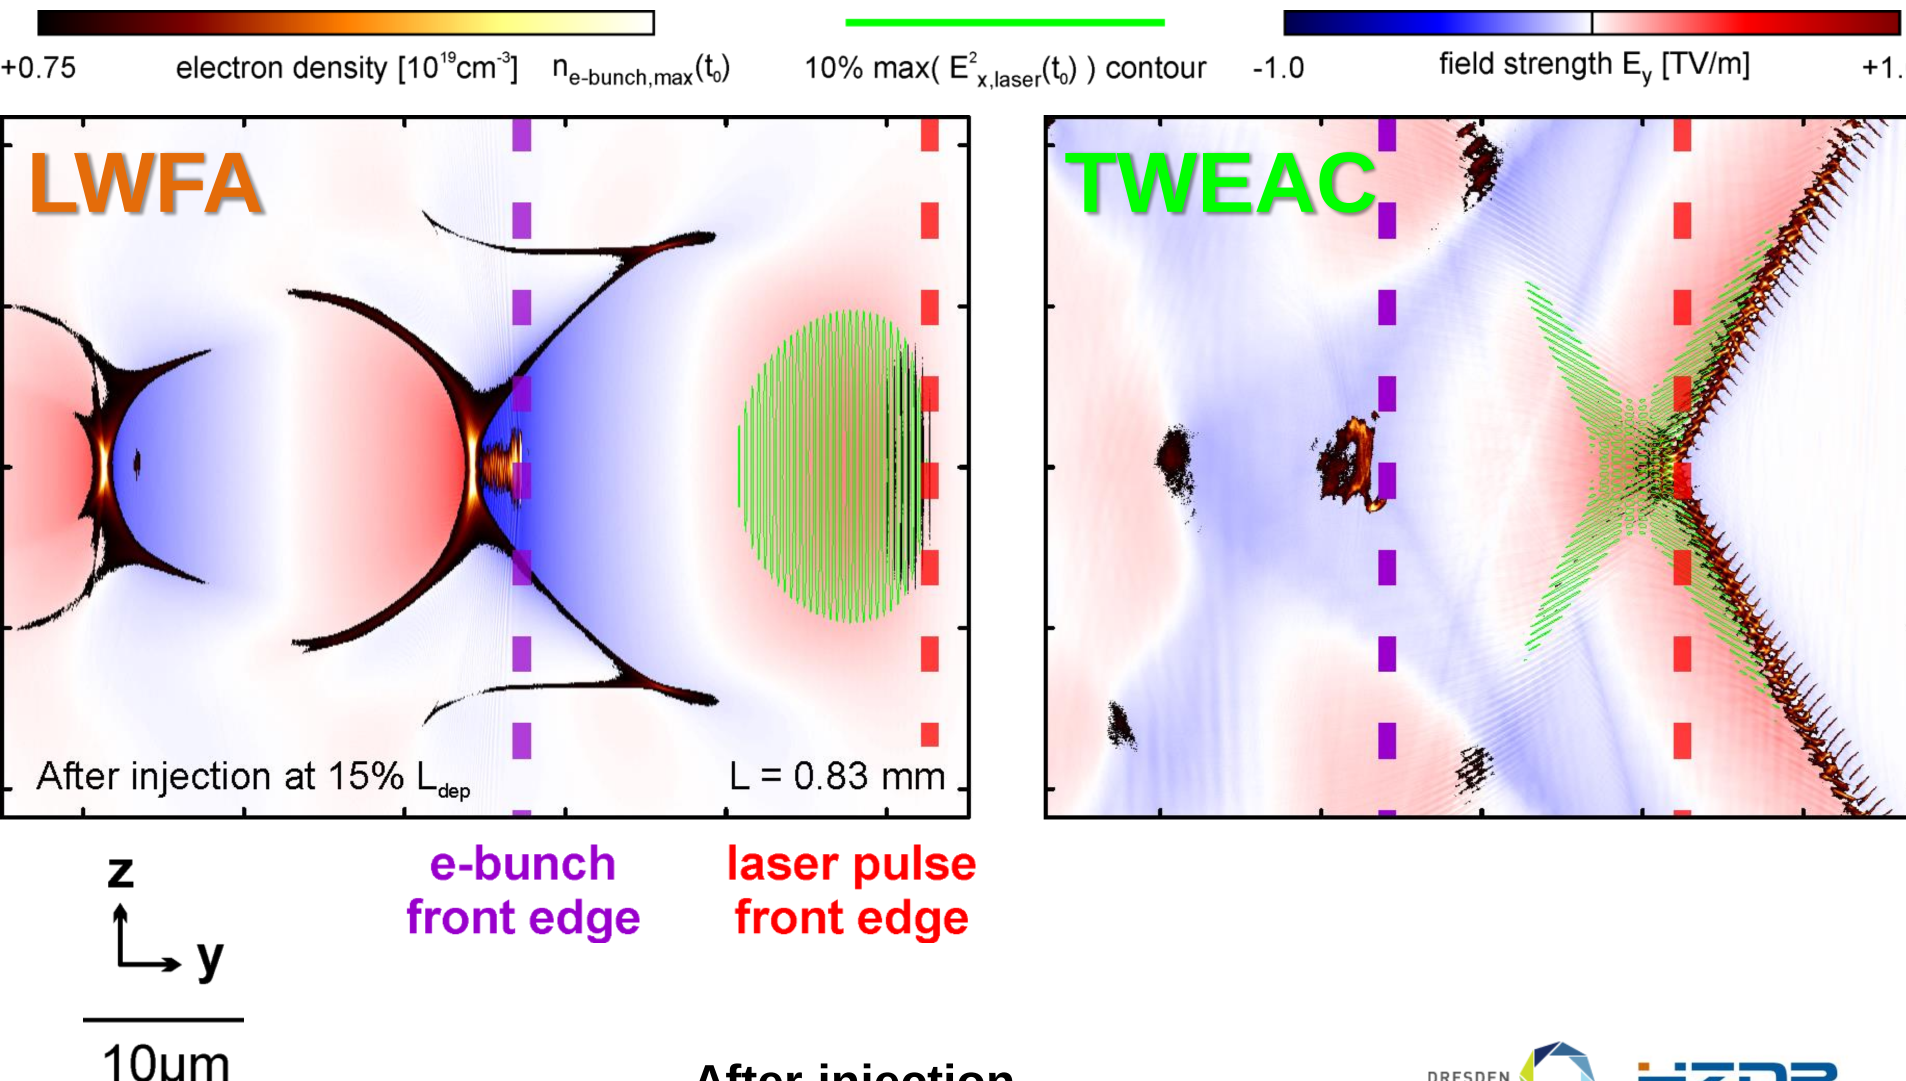
Simulate TWEAC using PIConGPU

- Field strengths of plasma cavity and focusing fields are comparable to LWFA.
- V-shaped cavity profile in the plane of laser propagation.
- Existance of side cavities.
- At constant density self-injection is absent.

a_0=3.5 each arm ; a_0 = 7.0 in overlap
Φ=60°; n_e=6.4 · 10^{18} cm^{-3} ; τ=10fs (FWHM)

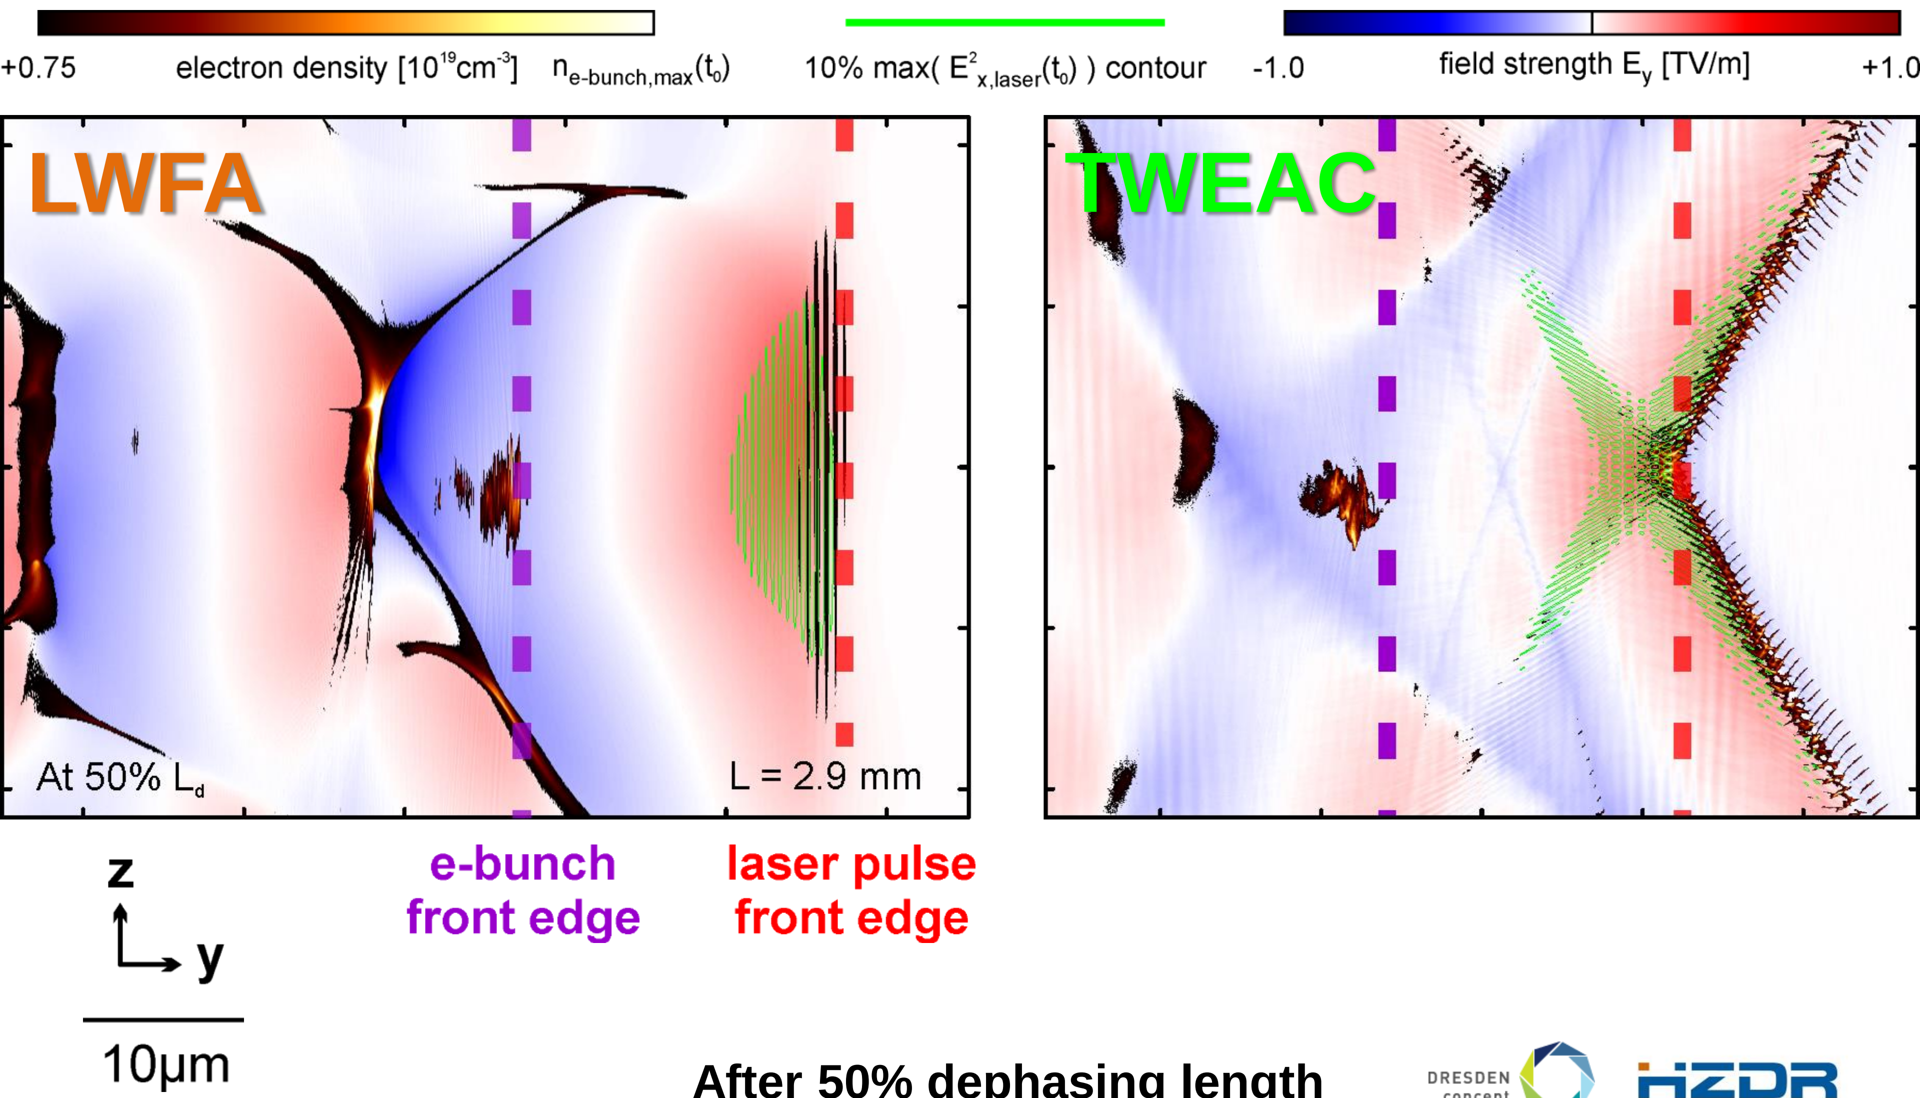


TWEAC eliminates the dephasing and depletion limit.



After injection

TWEAC eliminates the dephasing and depletion limit.

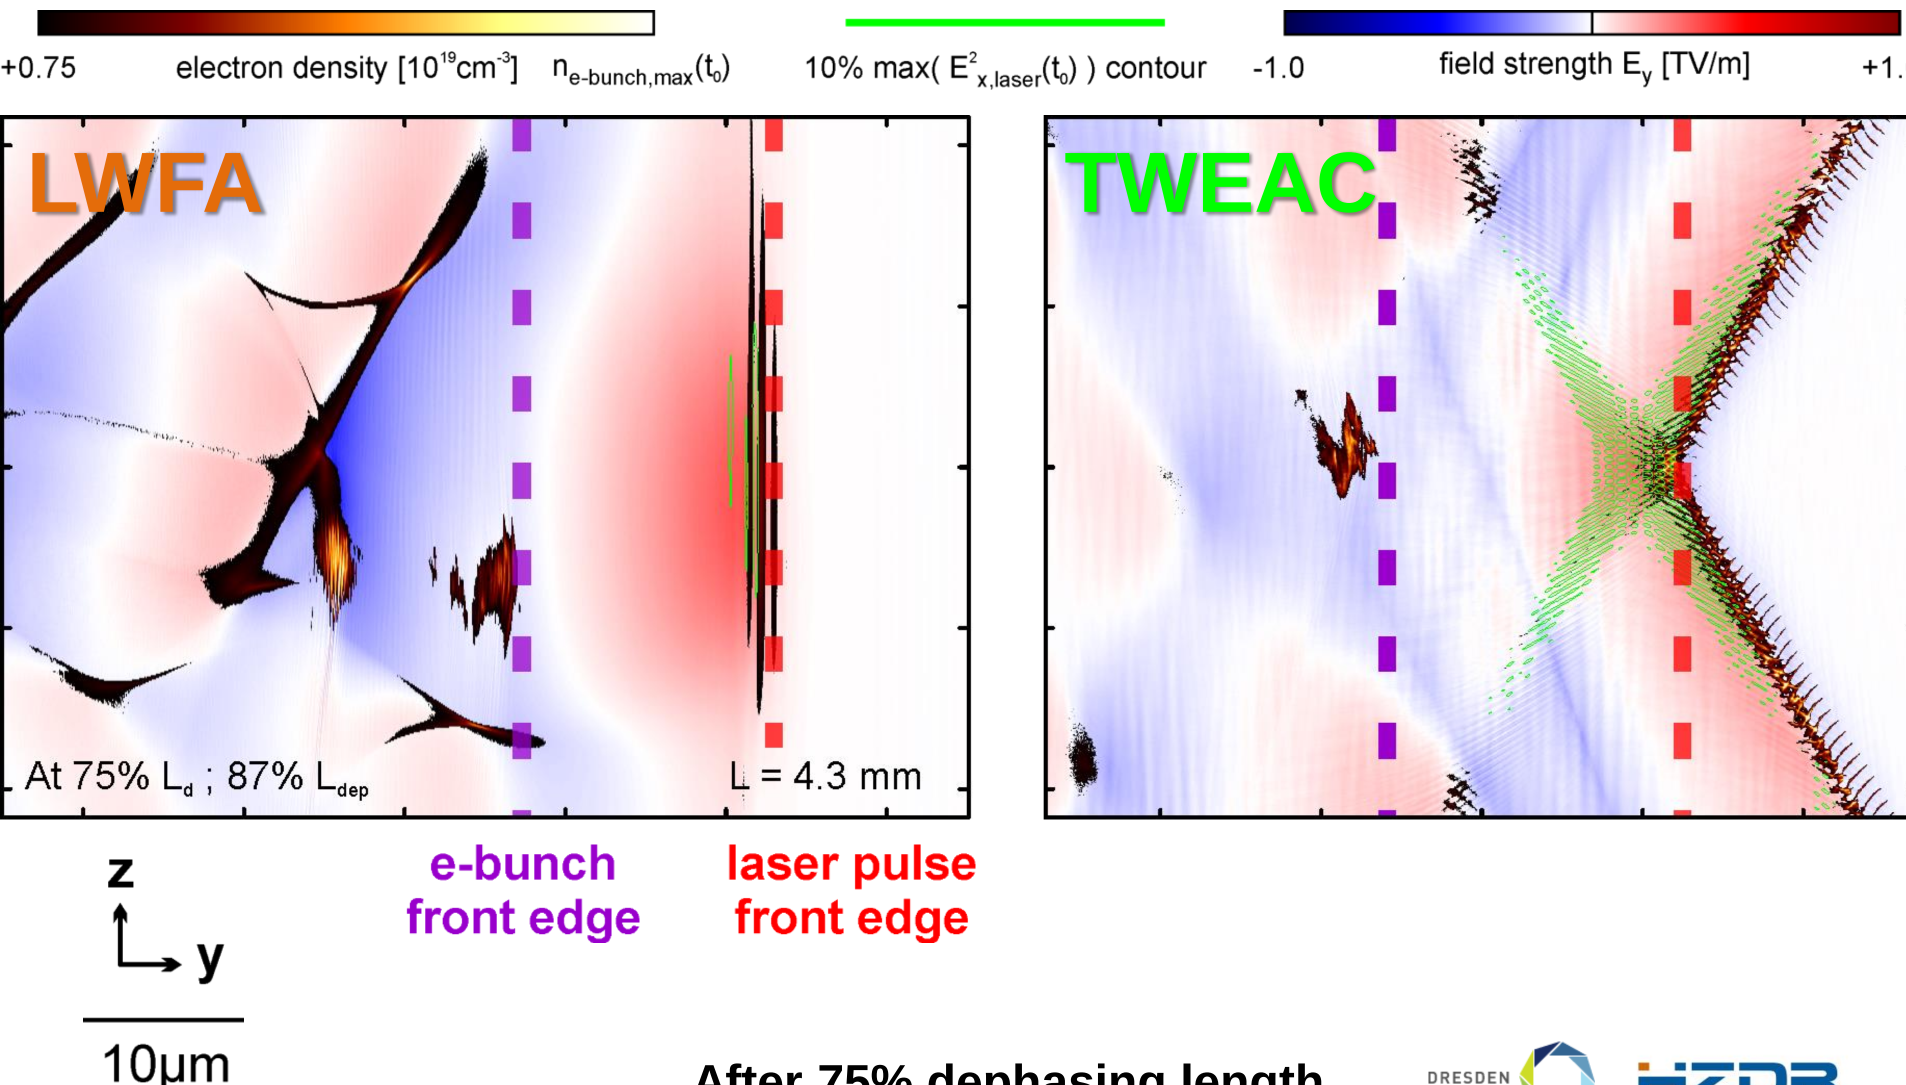


After 50% dephasing length

DRESDEN concept

HZDR

TWEAC eliminates the dephasing and depletion limit.

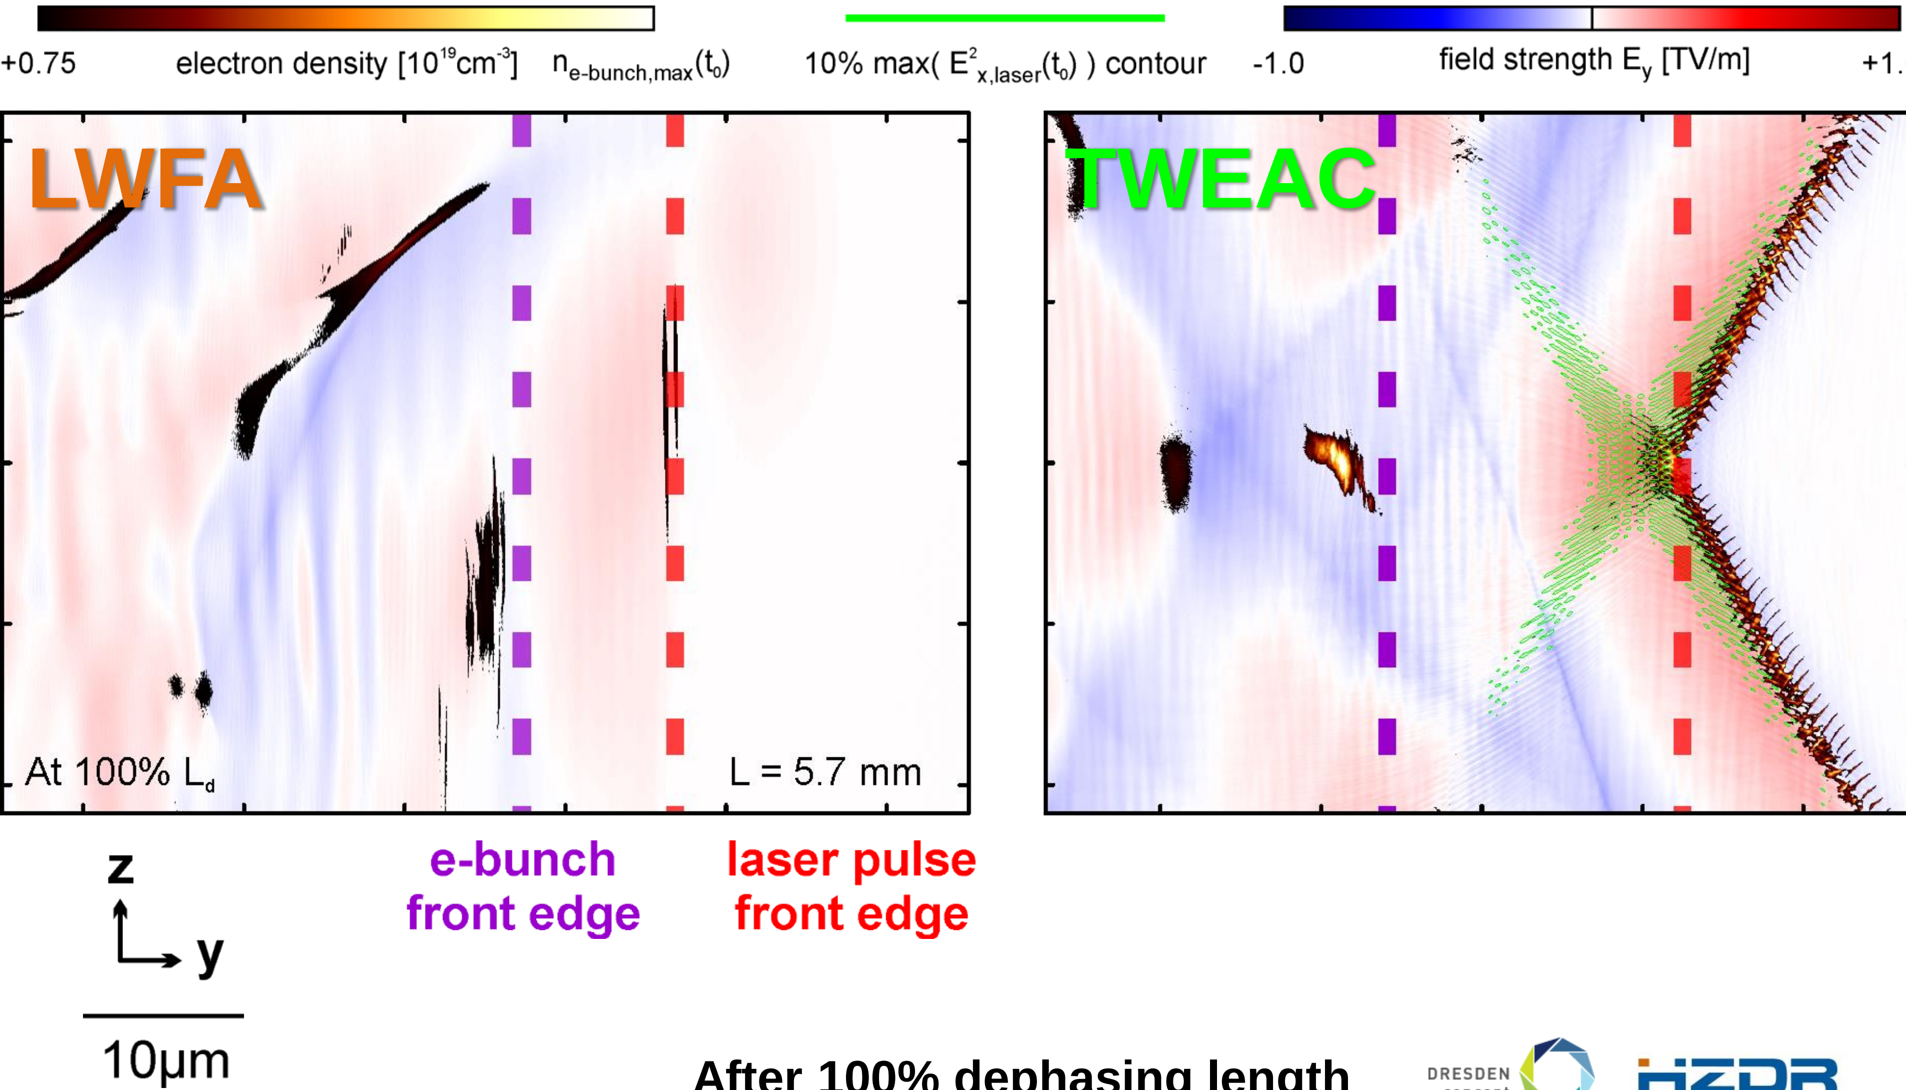


After 75% dephasing length

DRESDEN concept

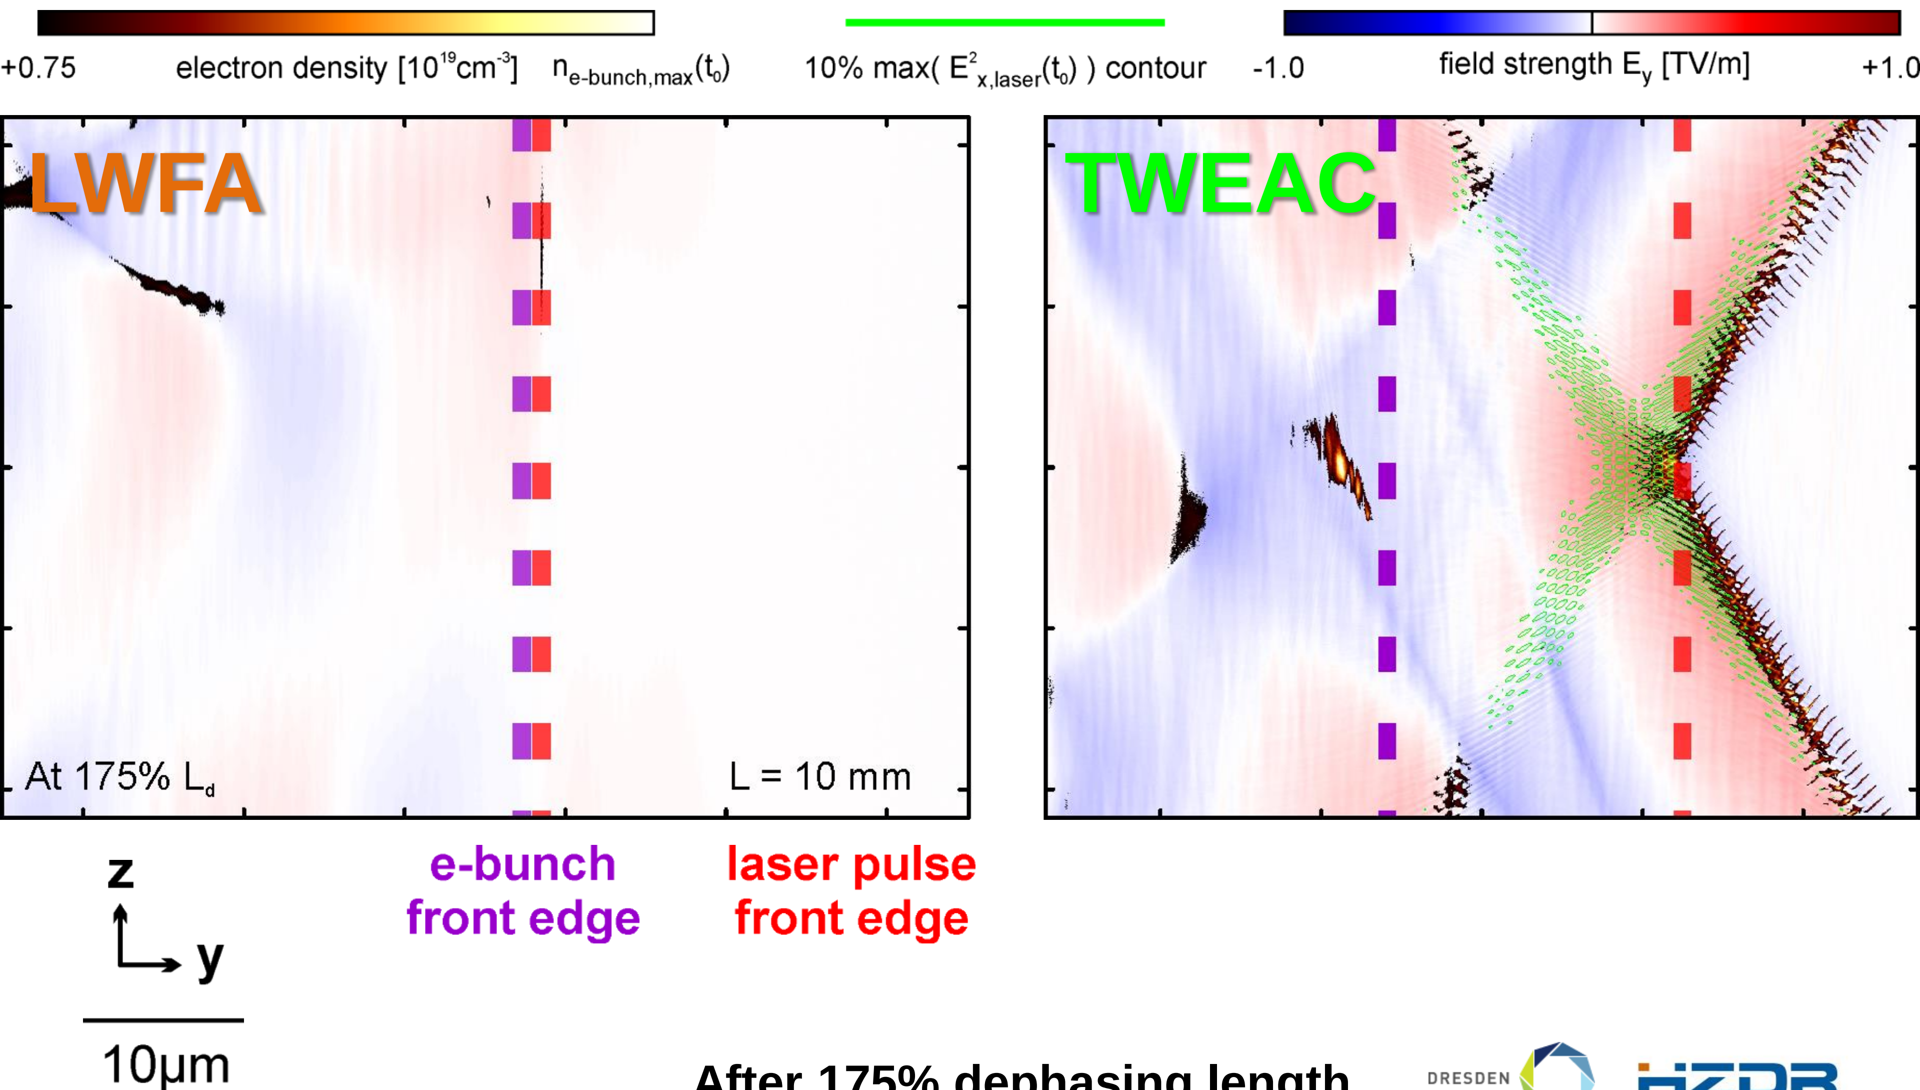
HZDR

TWEAC eliminates the dephasing and depletion limit.



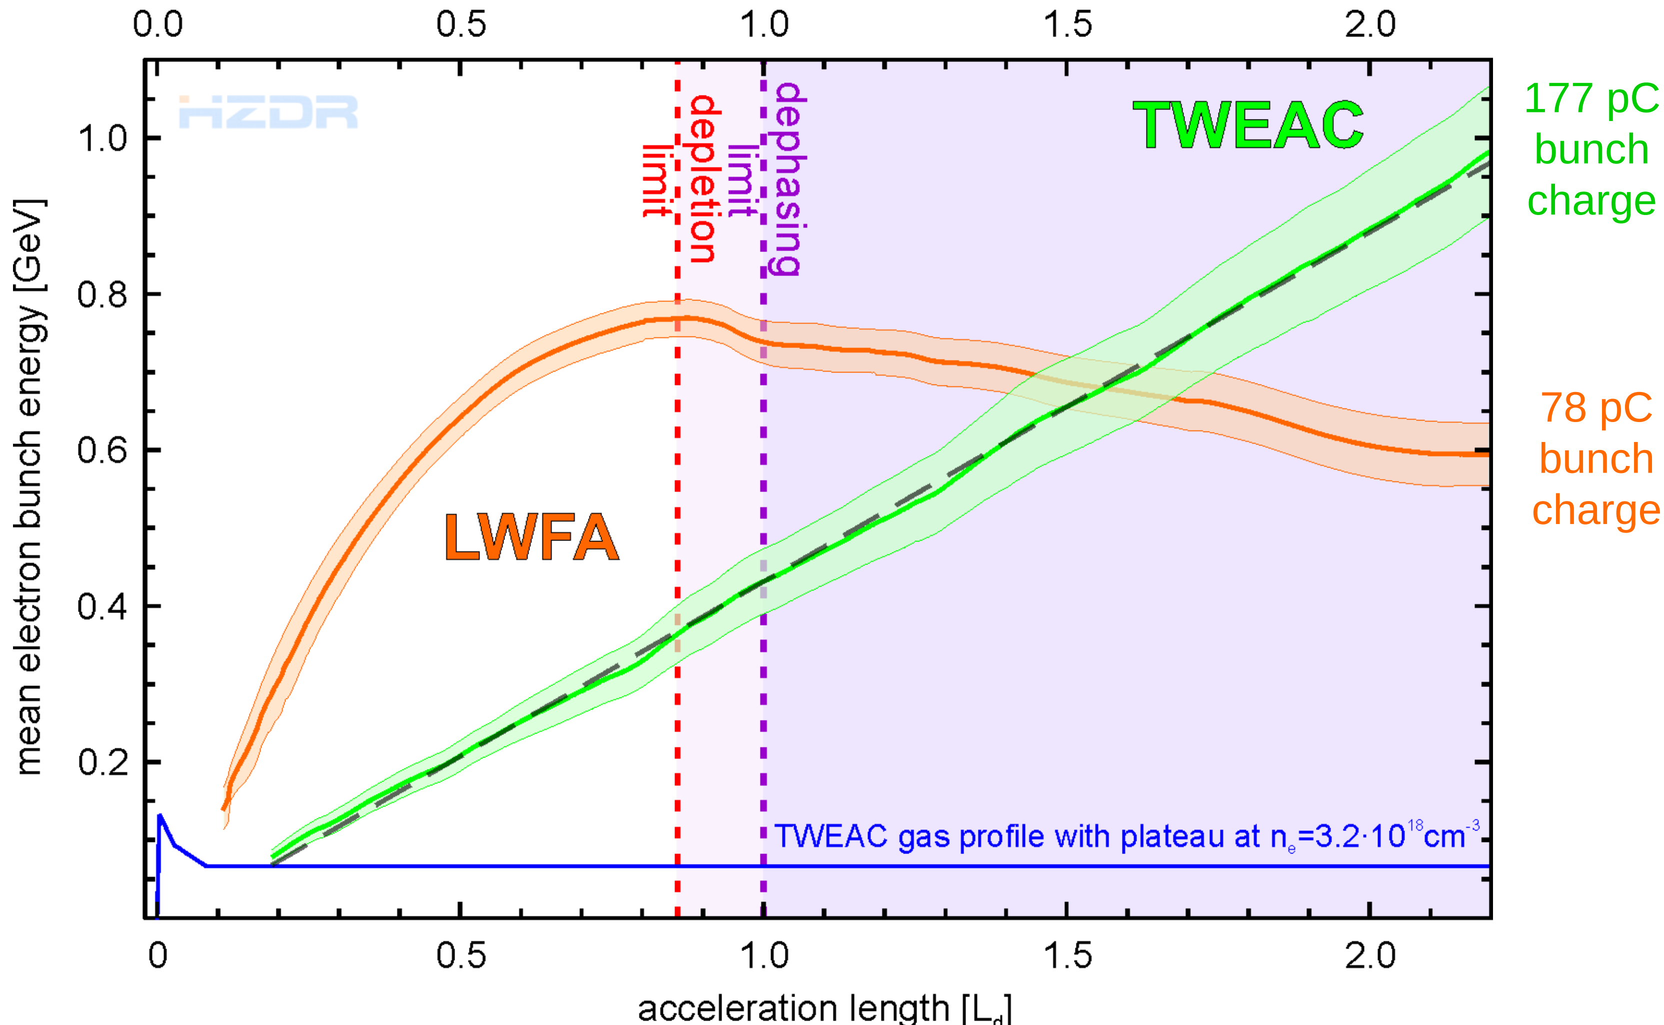
After 100% dephasing length

TWEAC eliminates the dephasing and depletion limit.



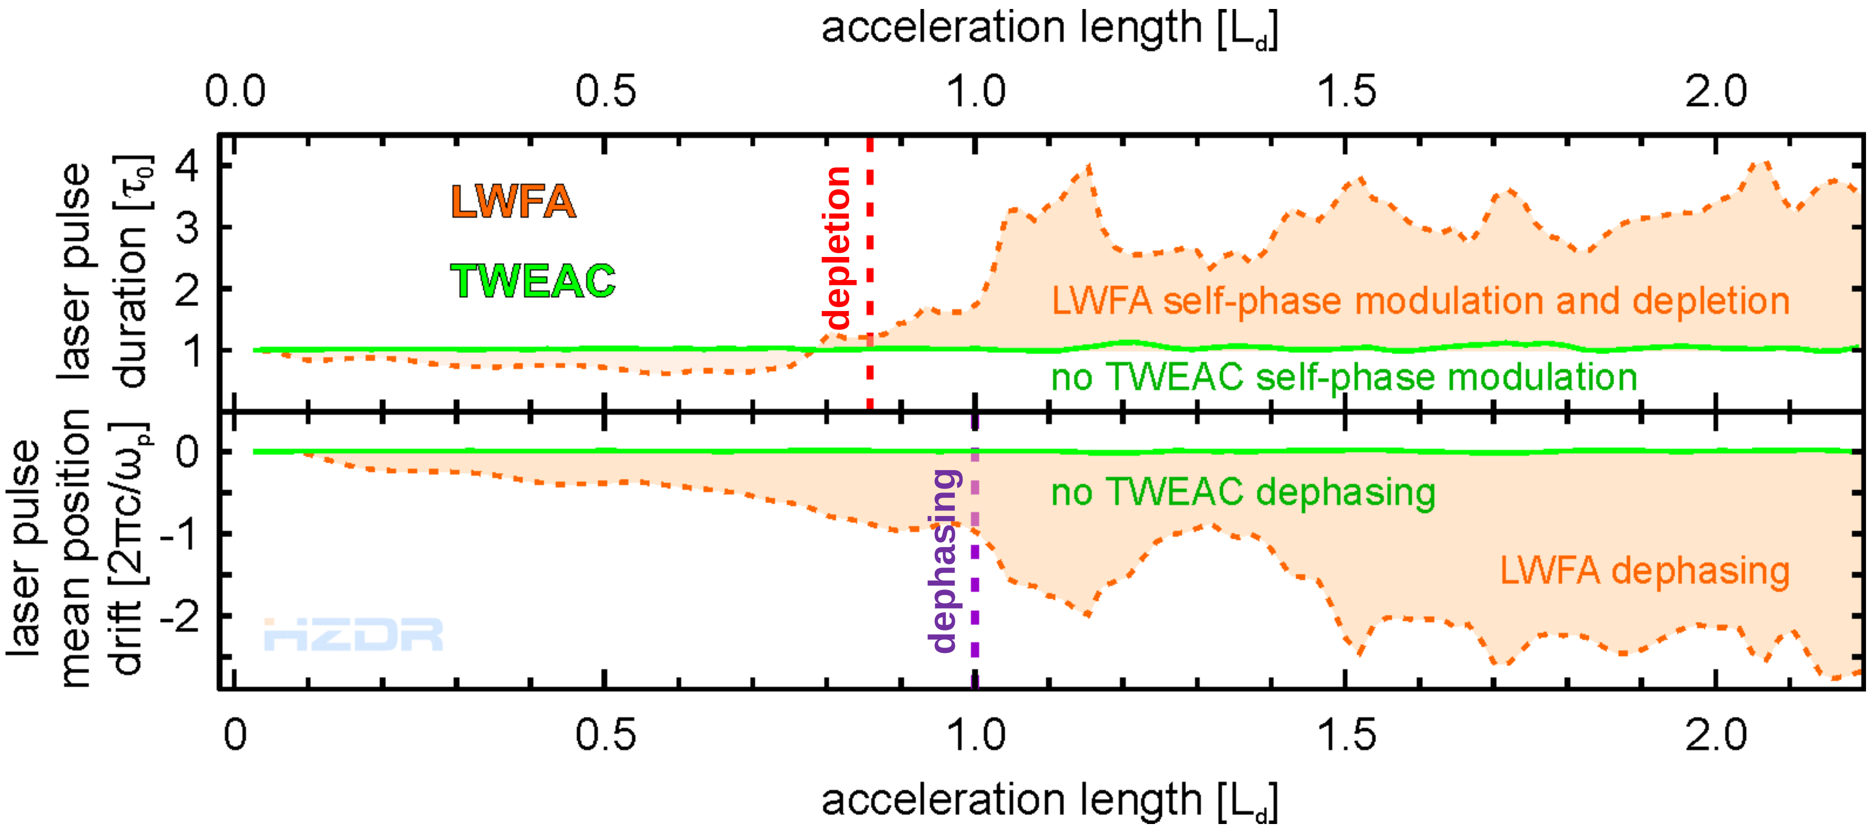
After 175% dephasing length

TWEAC mean electron electron energy evolves linearly with acceleration distance



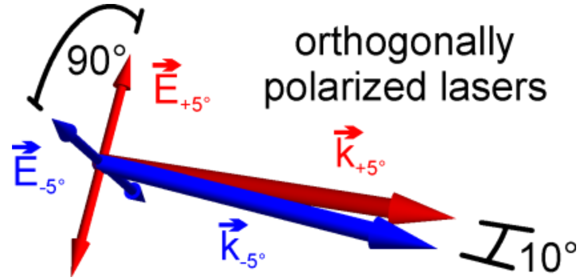
12.5 mm total plasma length

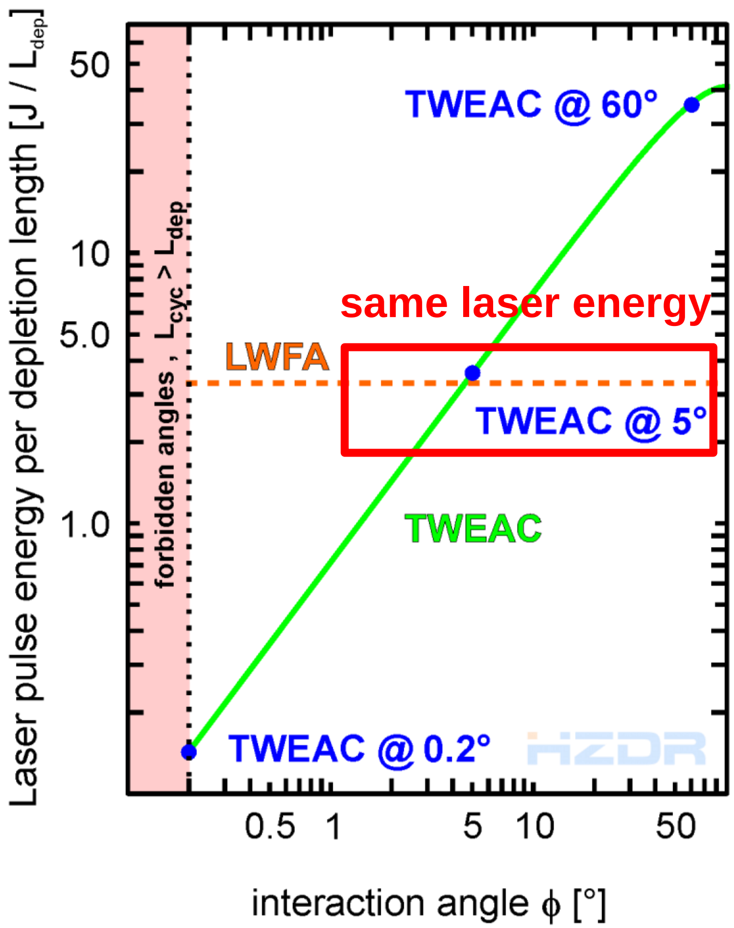
TWEAC maintains quasi-stationary plasma conditions

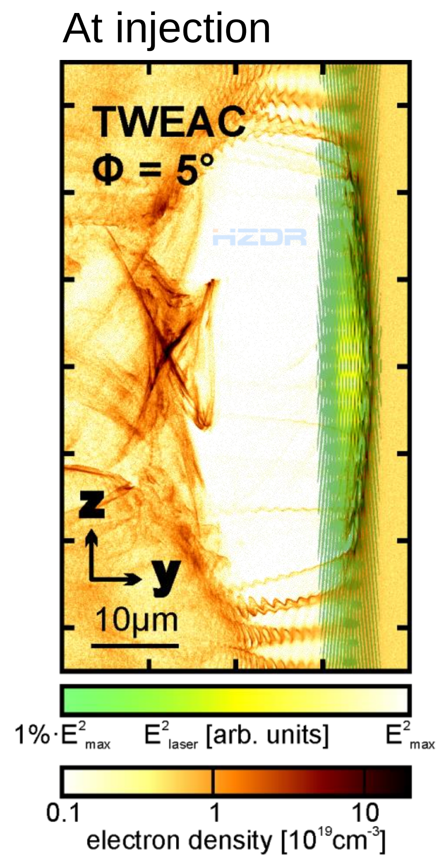


→ **TWEAC accelerator length can be made longer without dephasing or depletion.**

How does TWEAC scale in laser energy?







$$W_{\text{laser}} \propto a_0^2 \tau_0 L_{\text{int}} w_x \sin(\phi)$$

Low incidence angles ϕ reduce required laser energy, provided that

$$L_{\text{cyc}} < L_{\text{dep}}$$

where $L_{\text{cyc}} = L_{\text{trans}} / \sin(\phi)$ is independent of the total interaction distance L_{int}.

Low-angle TWEAC setups enable electron acceleration with high laser to electron beam efficiencies

- **High energy efficiencies can be reached**
  46.8% laser to electron beam energy efficiency,
  3.78 J/GeV energy-gain efficiency
  at 1.0 GeV/cm acceleration gradient

- **High electron beam charge**
  1.8nC down-ramp injected charge,
  330MeV with 18.9% energy spread (rms)

- **Flat electron beam**
  2.2µm x 4.8µm x 13µm (rms)
  from transversally extended cavity.

$2.5 \cdot 10^{18}\ cm^{-3}$, a_0=6.0, 800nm, $w_{0,x}$=1.2µm, 1.25J
330MeV with 18.9% (rms) energy spread

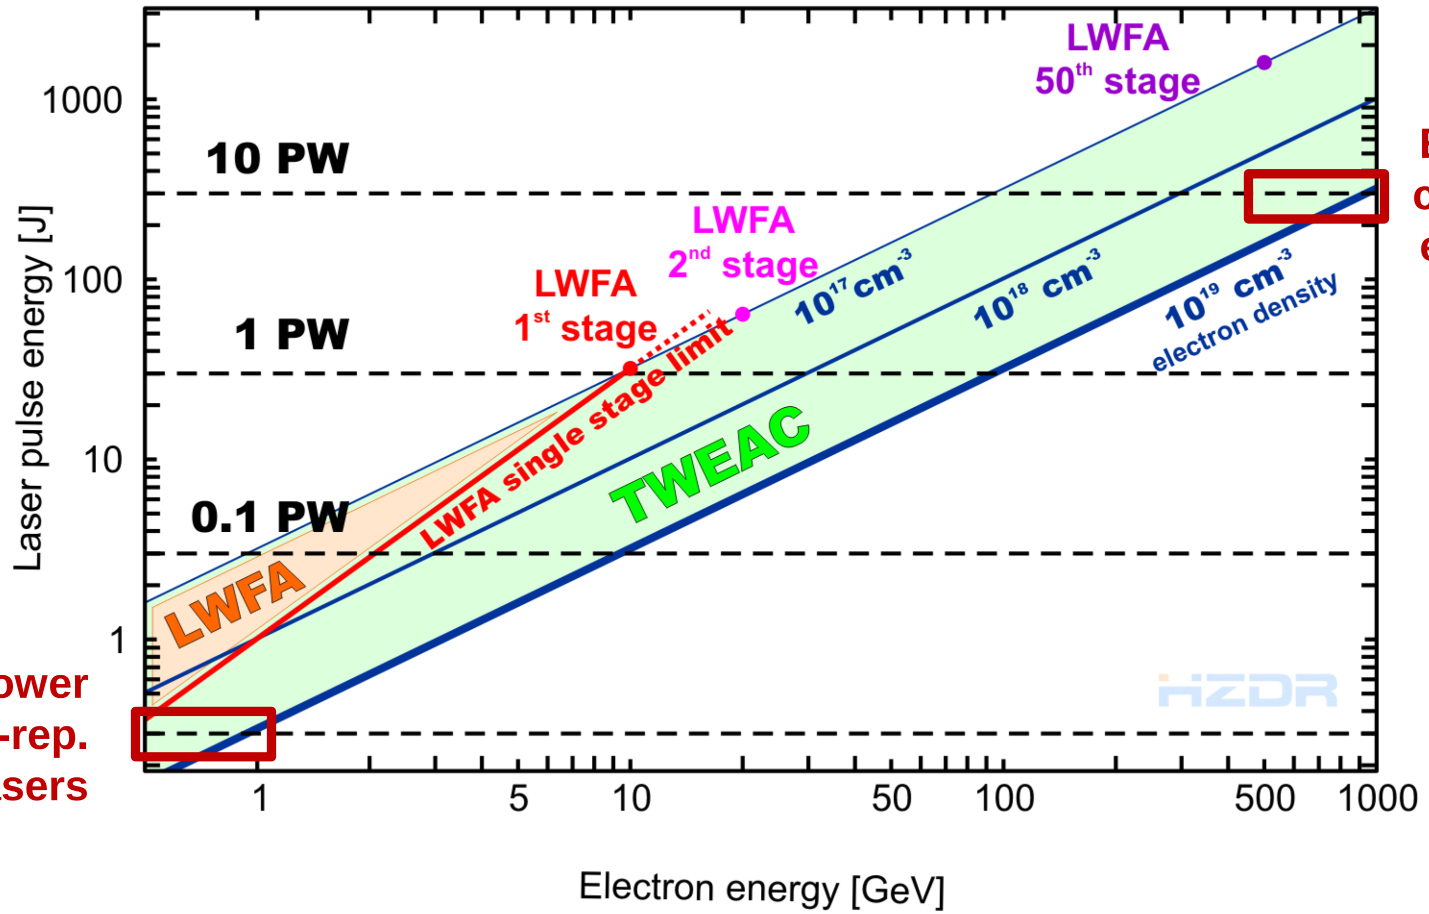
How does TWEAC scale in laser energy?



Low-power high-rep. lasers

ELI type lasers could reach the energy frontier

Paper submitted

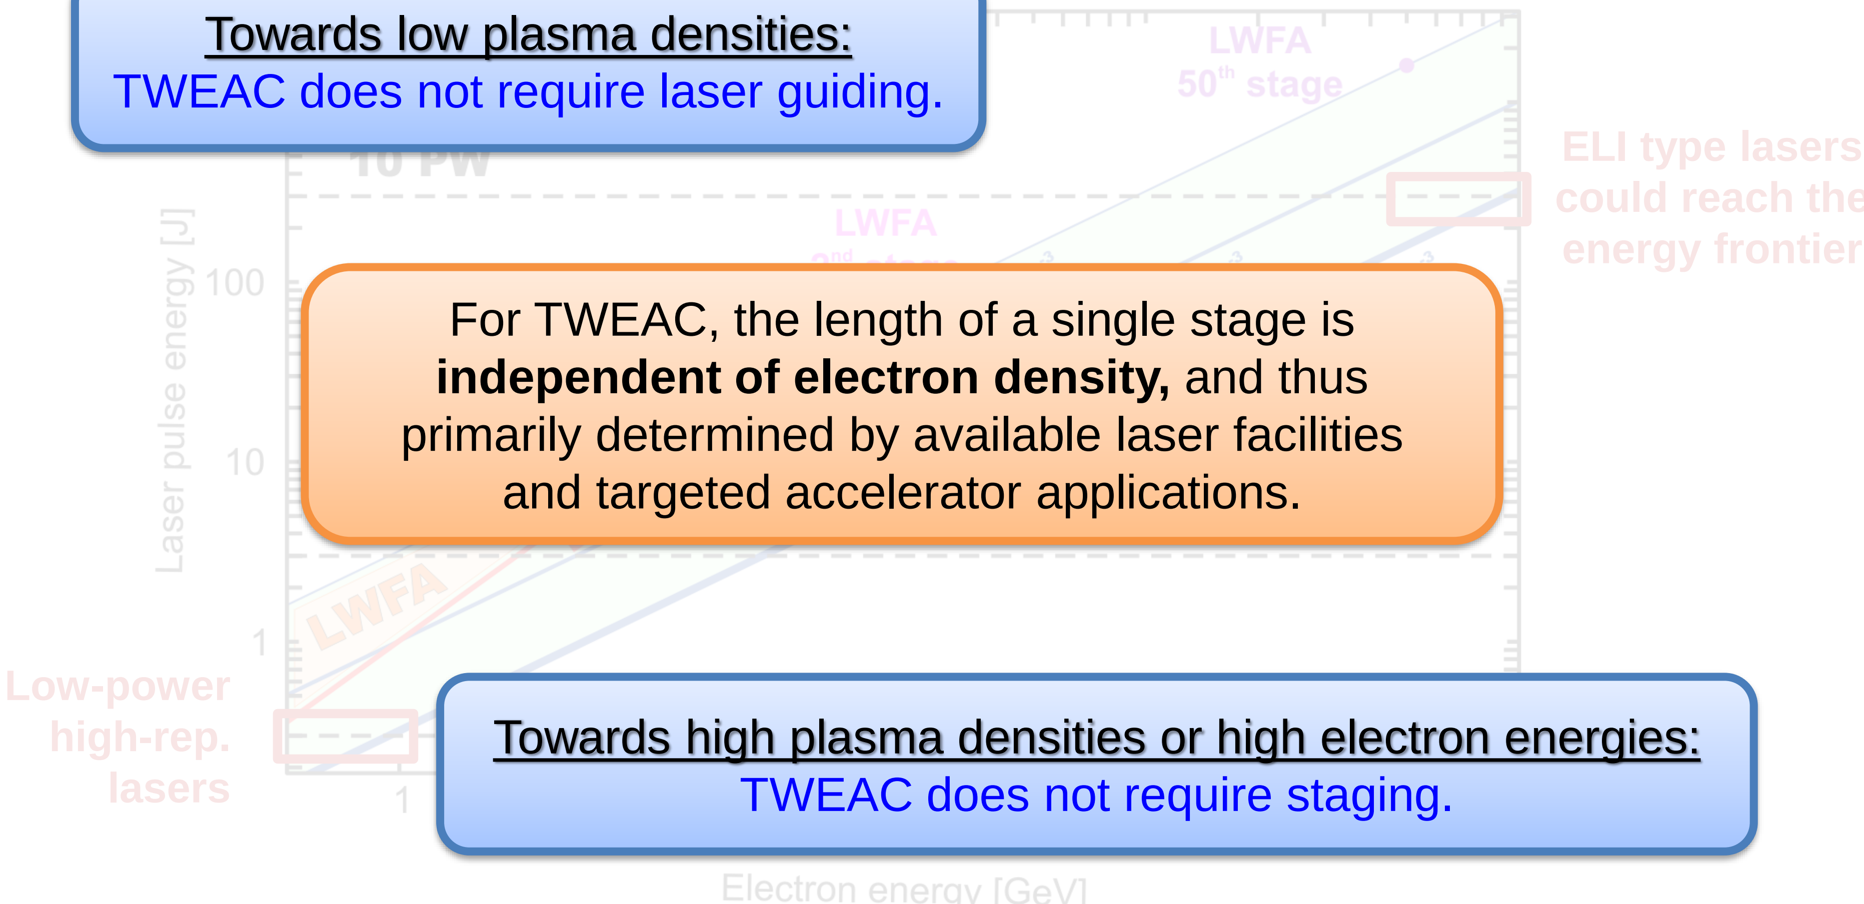
A. Debus *et al.*, *„Breaking the dephasing and depletion limits of laser-wakefield acceleration“*

LWFA scaling based on

C. B. Schroeder *et al.*, *Phys. Rev. Spec. Top. - Accel. Beams* **13,** 101301 (2010).

How does TWEAC scale in laser energy?

<u>Towards low plasma densities:</u>
TWEAC does not require laser guiding.



For TWEAC, the length of a single stage is **independent of electron density,** and thus primarily determined by available laser facilities and targeted accelerator applications.

<u>Towards high plasma densities or high electron energies:</u>
TWEAC does not require staging.

Conclusions

Traveling-wave electron acceleration (TWEAC)

- Eliminates the LWFA dephasing and depletion limits.
- Quasi-stationary plasma conditions without (parasitic) self-injection.
- No laser self-phase modulation along direction of electron acceleration.
- Can in principle be arbitrarily extended in a single stage up to the energy frontier.

Thank you for your attention!
